(54) Title: **NICOTINAMIDE BENZOFUSED-HETEROCYCLYL DERIVATIVES USEFUL AS SELECTIVE INHIBITORS OF  
PDE4 ISOZYMES**

(57) Abstract: Compounds useful as inhibitors of PDE4 in the treatment of diseases regulated by the activation and degranulation of eosinophils, especially asthma, chronic bronchitis, and chronic obstructive pulmonary disease, of Formula (1.0.0). In said formula R<sup>5</sup> and R<sup>6</sup> are taken together to form a moiety of partial Formulas (1.1.1) through (1.1.5) or a pharmaceutically acceptable salt thereof.

**NICOTINAMIDE BENZOFUSED - HETEROCYCLYL DERIVATIVES**  
**USEFUL AS SELECTIVE INHIBITORS OF PDE4 ISOZYMES**

**5    1.0    REFERENCE TO COPENDING APPLICATIONS**

Reference is made to co-pending International application and US application based thereon, Serial No. PCT/IB98/00315, both filed March 10, 1998 (Attorney Docket No. PC9762A), and published as WO 98/45268 on October 15, 1998; claiming priority from application Serial No. 60/043403 filed April 4, 1997 (Attorney Docket No. PC9762), now  
10    abandoned; which discloses nicotinamide derivatives having biological activity as inhibitors of PDE4 isozymes, and thus being useful in the treatment of inflammatory, respiratory and allergic diseases and conditions. Nothing that is disclosed in the above-mentioned applications would teach the person of ordinary skill in the pertinent art the novel compounds of the present invention or their unexpectedly high level of inhibitory selectivity for PDE 4  
15    isozymes.

Reference is also made to copending application Serial No. 09/345,185 filed June 30, 1999 (Attorney Docket No. PC10096A); claiming priority from application Serial No. 60/105,120 filed October 21, 1998 (Attorney Docket No. PC10096), which discloses compounds and processes for preparing N-substituted nicotinamide derivatives. However,  
20    the disclosed compounds and processes are not the same as those of the present invention.

Reference is further made to copending applications filed of even date with the instant application, Attorney Docket Nos. PC10523; PC10546; PC10690; PC10691; PC10698; and PC11848, which involve other classes of nicotinamide derivatives useful as inhibitors of PDE4 isozymes. The disclosures of all of said copending applications are  
25    incorporated herein by reference in their entireties.

**2.0    BACKGROUND OF THE INVENTION**

The 3',5'-cyclic nucleotide phosphodiesterases (PDEs) comprise a large class of enzymes divided into at least eleven different families which are structurally, biochemically  
30    and pharmacologically distinct from one another. The enzymes within each family are commonly referred to as isoenzymes, or isozymes. A total of more than fifteen gene products is included within this class, and further diversity results from differential splicing and post-translational processing of those gene products. The present invention relates to the four gene products of the fourth family of PDEs, i.e., PDE4A, PDE4B, PDE4C, and PDE4D, and  
35    their inhibition, including selective inhibition of PDE4D. These enzymes are collectively referred to as being isoforms or subtypes of the PDE4 isozyme family. Further below will be

found a more detailed discussion of the genomic organization, molecular structure and enzymatic activity, differential splicing, transcriptional regulation and phosphorylation, distribution and expression, and selective inhibition of the PDE4 isozyme subtypes.

The PDE4s are characterized by selective, high affinity hydrolytic degradation of the second messenger cyclic nucleotide, adenosine 3',5'-cyclic monophosphate (cAMP), and by sensitivity to inhibition by rolipram. A number of selective inhibitors of the PDE4s have been discovered in recent years, and beneficial pharmacological effects resulting from that inhibition have been shown in a variety of disease models. See, e.g., Torphy *et al.*, *Environ. Health Perspect.* 102 Suppl. 10, 79-84, 1994; Duplantier *et al.*, *J. Med. Chem.* 39 120-125, 1996; Schneider *et al.*, *Pharmacol. Biochem. Behav.* 50 211-217, 1995; Banner and Page, *Br. J. Pharmacol.* 114 93-98, 1995; Barnette *et al.*, *J. Pharmacol. Exp. Ther.* 273 674-679, 1995; Wright *et al.* "Differential *in vivo* and *in vitro* bronchorelaxant activities of CP-80633, a selective phosphodiesterase 4 inhibitor," *Can. J. Physiol. Pharmacol.* 75 1001-1008, 1997; Manabe *et al.* "Anti-inflammatory and bronchodilator properties of KF19514, a phosphodiesterase 4 and 1 inhibitor," *Eur. J. Pharmacol.* 332 97-107, 1997; and Ukita *et al.* "Novel, potent, and selective phosphodiesterase-4 inhibitors as antiasthmatic agents: synthesis and biological activities of a series of 1-pyridyl-naphthalene derivatives," *J. Med. Chem.* 42 1088-1099, 1999. Accordingly, there continues to be considerable interest in the art with regard to the discovery of further selective inhibitors of PDE4s.

The present invention is also concerned with the use of selective PDE4 inhibitors for the improved therapeutic treatment of a number of inflammatory, respiratory and allergic diseases and conditions, but especially for the treatment of asthma; chronic obstructive pulmonary disease (COPD) including chronic bronchitis, emphysema, and bronchiectasis; chronic rhinitis; and chronic sinusitis. Heretofore in the art, however, the first-line therapy for treatment of asthma and other obstructive airway diseases has been the nonselective PDE inhibitor theophylline, as well as pentoxifylline and IBMX, which may be represented by Formulas (0.0.1), (0.0.2), and (0.0.3), respectively:

Theophylline  
(0.0.1)

Pentoxifylline

(0.0.2)

- 3 -

(0.0.3)

Theophylline, which has the PDEs as one of its biochemical targets, in addition to its well characterized bronchodilatory activity, affects the vasculature of patients with increased pulmonary artery pressure, suppresses inflammatory cell responses, and induces apoptosis of eosinophils. Theophylline's adverse events, most commonly cardiac dysrhythmias and nausea, are also mediated by PDE inhibition, however, leading to the search for more selective inhibitors of PDEs that are able to suppress both immune cell functions *in vitro* and allergic pulmonary inflammation *in vivo*, while at the same time having improved side-effect profiles. Within the airways of patients suffering from asthma and other obstructive airway diseases, PDE4 is the most important of the PDE isozymes as a target for drug discovery because of its distribution in airway smooth muscle and inflammatory cells. Several PDE4 inhibitors introduced to the art thus far have been designed to have an improved therapeutic index concerning the cardiovascular, gastrointestinal, and central nervous system side effects of the above-mentioned nonselective xanthines.

Airflow obstruction and airway inflammation are features of asthma as well as COPD. While bronchial asthma is predominantly characterized by an eosinophilic inflammation, neutrophils appear to play a major role in the pathogenesis of COPD. Thus, PDEs that are involved in smooth muscle relaxation and are also found in eosinophils as well as neutrophils probably constitute an essential element of the progress of both diseases. The PDEs involved include PDE3s as well as PDE4s, and bronchodilating inhibitors have been discovered which are selective PDE3 inhibitors and dual PDE3/4 selective inhibitors. Examples of these are milrinone, a selective PDE3 inhibitor, as well as zardaverine and benafentrine, both dual PDE3/4 selective inhibitors, which may be represented by Formulas (0.0.4), (0.0.5), and (0.0.6), respectively:

(0.0.5)

- 4 -

Benafentrine

(0.0.6)

However, benafentrine results in bronchodilation only when administered by inhalation, and zardaverine produces only a modest and short-lived bronchodilation. Milrinone, a cardiotonic agent, induces short-lived bronchodilation and a slight degree of protection against induced bronchoconstriction, but has marked adverse events, e.g., tachycardia and hypotension. Unsatisfactory results have also been obtained with a weakly selective PDE4 inhibitor, tibenelast, and a selective PDE5 inhibitor, zaprinast, which may be represented by Formulas (0.0.7) and (0.0.8):

Tibenelast  
(0.0.7)

Zaprinast

(0.0.8)

More relative success has been obtained in the art with the discovery and development of selective PDE4 inhibitors.

*In vivo*, PDE4 inhibitors reduce the influx of eosinophils to the lungs of allergen-challenged animals while also reducing the bronchoconstriction and elevated bronchial responsiveness occurring after allergen challenge. PDE4 inhibitors also suppress the activity of immune cells, including CD4<sup>+</sup> T-lymphocytes, monocytes, mast cells, and basophils; reduce pulmonary edema; inhibit excitatory nonadrenergic noncholinergic neurotransmission (eNANC); potentiate inhibitory nonadrenergic noncholinergic neurotransmission (iNANC); reduce airway smooth muscle mitogenesis; and induce bronchodilation. PDE4 inhibitors also suppress the activity of a number of inflammatory cells associated with the pathophysiology of COPD, including monocytes/macrophages, CD8<sup>+</sup> T-lymphocytes, and neutrophils. PDE4 inhibitors also reduce vascular smooth muscle mitogenesis and, and potentially interfere with the ability of airway epithelial cells to generate pro-inflammatory mediators. Through the release of neutral proteases and acid hydrolases from their granules, and the generation of reactive oxygen species, neutrophils contribute to the tissue destruction associated with

chronic inflammation, and are further implicated in the pathology of conditions such as emphysema.

Selective PDE4 inhibitors which have been discovered thus far that provide therapeutic advantages include SB-207,499, identified as ARIFLO®, which may be represented by Formula (0.1.9):

SB-207,499

(0.1.9)

SB-207,499, administered orally at dosages of 5, 10, and 15 mg *b.i.d.*, has produced significant increases in trough FEV<sub>1</sub> (forced expiratory volume in 1 second) from placebo at week 2 of a study involving a large number of patients. Another potent, selective PDE4 inhibitor, CDP840, has shown suppression of late reactions to inhaled allergen after 9.5 days of oral administration at doses of 15 and 30 mg in a group of patients with bronchial asthma. CDP840 may be represented by Formula (0.0.9):

CDP840

(0.0.9)

PDEs have also been investigated as potential therapy for obstructive lung disease, including COPD. In a large study of SB-207,499 in patients with COPD, the group of patients receiving 15 mg *b.i.d.* has experienced a progressive improvement in trough FEV<sub>1</sub>, reaching a maximum mean difference compared with placebo of 160 mL at week 6, which represents an 11% improvement. See Compton *et al.*, "The efficacy of Ariflo (SB207499), a second generation, oral PDE4 inhibitor, in patients with COPD," *Am. J. Respir. Crit. Care Med.* **159**, 1999. Patients with severe COPD have been observed to have pulmonary hypertension, and decreases in mean pulmonary artery pressure under clinical conditions have been achieved by oral administration of the selective PDE3 inhibitors milrinone and enoximone. Enoximone has also been shown to reduce airway resistance in patients hospitalized with decompensated COPD. See Leeman *et al.*, *Chest* **91** 662-6, 1987. Using selective PDE3 inhibition by motapizone and selective PDE5 inhibition by zaprinast, it has been shown that combined inhibition of PDE 3 and 5 exerts a relaxation of pulmonary artery rings which corresponds broadly to the pattern of PDE isozymes found in the pulmonary artery smooth muscle. See Rabe *et al.*, *Am. J. Physiol.* **266** (LCMP 10): L536-L543, 1994. The structures of milrinone and zaprinast are shown above as Formulas (0.0.4) and (0.0.8), respectively.

The structures of enoximone and motapizone may be represented by Formulas (0.0.10) and (0.0.11), respectively:

The effects of PDE4 inhibitors on various inflammatory cell responses can be used as a basis for profiling and selecting inhibitors for further study. These effects include elevation of cAMP and inhibition of superoxide production, degranulation, chemotaxis, and tumor necrosis factor alpha (TNF $\alpha$ ) release in eosinophils, neutrophils and monocytes. PDE4 inhibitors may induce emesis, *i.e.*, nausea and vomiting, which, as expected, is an adverse effect. The emesis adverse effect became apparent when PDE4 inhibitors were first investigated for CNS indications such as depression, when rolipram and denbufylline were used in clinical trials. Rolipram and denbufylline may be represented by Formulas (0.0.12) and (0.0.13), respectively:

The mechanism(s) by which PDE4 inhibitors may potentially induce emesis is/are uncertain, but a study of the PDE4 inhibitor Ro-20-1724 suggests that nausea and vomiting are at least partially mediated by the emesis centers in the brain. Gastrointestinal adverse events may be caused by local effects, *e.g.*, rolipram is a very potent stimulator of acid secretion from gastric parietal cells, and the resulting excess acid, by producing local irritation, may exacerbate gastrointestinal disturbances. Ro-20-1724 may be represented by Formula (0.0.14):

Efforts to minimize or eliminate the above-mentioned adverse events sometimes associated with PDE4 inhibitors have included creating inhibitors which do not penetrate the central nervous system, and administering PDE4 inhibitors by inhalation rather than orally.

With regard to the PDE4 subtypes, A, B, C, and D, it has been found that PDE4C is usually less sensitive to all inhibitors; whereas, with respect to the subtypes A, B, and D, there is as yet no clear evidence of inhibitor specificity, which is defined as a 10-fold difference in  $IC_{50}$  values. While most inhibitors, especially RS-25,344, are more potent against PDE4D, this does not amount to selectivity. RS-25,344 may be represented by Formula (0.0.15):

RS-25,344

(0.0.15)

On the other hand, there is a stereoselective effect on the elevation of cAMP in a range of cell types, which has been demonstrated with the results of an investigation of CDP840, shown above as Formula (0.0.9), and its less active enantiomer CT-1731, which is represented by Formula (0.0.16):

CT-1731

(0.0.16)

It has been known for some time that rolipram had the ability to interact with a high-affinity binding site on brain membranes, and it was later established in the art that this high-affinity rolipram binding site ( $S_r$ ), which is distinct from the catalytic site ( $S_c$ ), exists in a truncated recombinant PDE4A and a full-length recombinant PDE4B. More recently,  $S_r$  has been identified on all four PDE4 subtypes. See Hughes *et al.*, *Drug Discovery Today* 2(3) 89-101, 1997. The presence of  $S_r$  appears to have a profound effect on the ability of certain inhibitors such as rolipram and RS-25,344 to inhibit the catalytic activity of PDE4 isozymes.

The impact of residues on inhibitor binding is also significant. A single amino acid substitution (alanine for aspartate) in the catalytic region of PDE4B has been shown to be critical for inhibition by rolipram, and this appears to be a class effect because related inhibitors RP-73,401 and Ro-20-1724 also lose potency on the mutant enzyme. However, the role of binding of inhibitors to the  $S_c$  or to the  $S_r$ , in terms of elevation of cAMP and inhibition of cell responses, is not fully understood at the present time.

RP-73,401, in guinea-pig studies, has been found to be active in (1) the inhibition of antigen-induced lung eosinophilia and eosinophil peroxidase (EPO), Banner, K.H., "The effect of selective phosphodiesterase inhibitors in comparison with other anti-asthma drugs on allergen-induced eosinophilia in guinea-pig airways," *Pulm. Pharmacol.* 8 37-42, 1995; (2) antigen-induced bronchoalveolar lavage (BAL) eosinophilia, Raeburn *et al.*, "Anti-inflammatory and bronchodilator properties of RP73401, a novel and selective phosphodiesterase Type IV inhibitor," *Br. J. Pharmacol.* 113 1423-1431, 1994; (3) antigen-induced airway eosinophilia and platelet activating factor- (PAF)- and ozone-induced airway hyper-responsiveness (AHR), Karlsson *et al.*, "Anti-inflammatory effects of the novel phosphodiesterase IV inhibitor RP73401," *Int. Arch. Allergy Immunol.* 107 425-426, 1995; and (4) IL-5 induced pleural eosinophilia. Development of RP-73,401, piclamilast, has been discontinued. Piclamilast may be represented by Formula (0.0.17):

Piclamilast (RP-73,401)

(0.0.17)

A related series of compounds is represented by RPR-132294 and RPR-132703, which have been demonstrated in rat studies to have activity in the inhibition of antigen-induced bronchospasm; Escott *et al.*, "Pharmacological profiling of phosphodiesterase 4 (PDE4) inhibitors and analysis of the therapeutic ratio in rats and dogs," *Br. J. Pharmacol.* 123(Proc. Suppl.) 40P, 1998; and Thurairatnam *et al.*, "Biological activity and side effect profile of RPR-132294 and RPR-132703 - novel PDE4 inhibitors," *XV<sup>th</sup> EFMC Int. Symp. Med. Chem.*, 1998. The structure of RPR-132294 may be represented by Formula (0.0.18):

RPR-132294

(0.0.18)

Another compound whose development has been discontinued is WAY-PDA-641, filaminast, which in studies in the dog, has been found to be active in the inhibition of serotonin-induced bronchoconstriction. Filaminast may be represented by Formula (0.0.19):

Filaminast (WAY-PDA-641)

(0.0.19)

It has been suggested in the art that PDE4 inhibitors that have a high affinity at the S<sub>r</sub> can be correlated with emesis and increased gastric acid secretion. RS-23,544, RP-73,401, and CP-80,633 elicit emesis and have a high affinity at the S<sub>r</sub>. CDP840 and SB-207,499 have a comparatively low affinity at the S<sub>r</sub>, but CDP840 has a significantly higher potency at the S<sub>c</sub> than does SB-207,499. CDP840 has been demonstrated to provide significant inhibition of late-phase response in the treatment of asthma without any adverse events of nausea or headache. Another PDE4 inhibitor that has been shown to have adverse events of nausea and vomiting is BRL-61,063, also referred to as cipamfylline, which is described further below. The development of CDP840 has been discontinued, while CP-80,633, atizoram, continues in development. CP-80,633 and BRL-61,063 may be represented by Formulas (0.0.20) and (0.1.12), respectively:

Atizoram (CP-80,633)  
(0.0.20)

Cipamfylline (BRL-61,063)

(0.1.12)

Another compound which is in development is LAS-31025, arofylline, which in guinea-pig studies, has been found to be active in the inhibition of antigen-induced bronchoconstriction; Beleta, B. J., "Characterization of LAS31025: a new selective PDE IV inhibitor for bronchial asthma," *Third Int. Conf. On Cyclic Nucleotide Phosphodiesterase: From Genes to Therapies*, Glasgow, UK, 1996, Abstract 73. LAS-31025, arofylline, may be represented by Formula (0.0.21):

- 10 -

Arofyline (LAS-31025)

(0.0.21)

A number of PDE4 inhibitors have been advanced in development. For example, the effects of V-11294A on LPS-stimulated *ex vivo* TNF release and PHA induced lymphocyte proliferation have been determined in a randomized, double-blind placebo-controlled study which has found that an oral dose of 300 mg is effective in reducing TNF levels and lymphocyte proliferation; Landells *et al.*, "Oral administration of the phosphodiesterase (PDE) 4 inhibitor, V11294A inhibits *ex-vivo* agonist-induced cell activation," *Eur. Resp. J.* 12(Suppl. 28) 362s, 1998; and Gale *et al.*, "Pharmacodynamic-pharmacokinetic (PD/PK) profile of the phosphodiesterase (PDE) 4 inhibitor, V11294A, in human volunteers," *Am. J. Respir. Crit. Care Med.* 159 A611, 1999.

The compound D4418 has been administered to healthy volunteers in a single escalating dose, randomized, placebo-controlled Phase I study; Montana *et al.*, "Activity of D4418, a novel phosphodiesterase 4 (PDE4) inhibitor, effects in cellular and animal models of asthma and early clinical studies," *Am. J. Respir. Crit. Care Med.* 159 A108, 1999. D4418 is a moderately potent PDE4 inhibitor with an  $IC_{50}$  of 200 nM. It has good oral absorption; a 200 mg dose provides a plasma  $C_{max}$  of 1.4  $\mu$ g/ml. D4418 has been discontinued from development due to its moderate potency, and has been replaced by the preclinical development candidate D4396.

V-11294A and D4418 may be represented by Formulas (0.0.22) and (0.0.23), respectively:

V-11294A  
(0.0.22)

D4418

(0.0.23)

Another compound, CI-1018, has been evaluated in 54 subjects and no adverse events were reported at doses up to 400 mg; Pruniaux *et al.*, "The novel phosphodiesterase inhibitor CI-1018 inhibits antigen-induced lung eosinophilia in sensitized brown-norway rats - comparison with rolipram," *Inflammation* S-04-6, 1999. CI-1018 has been demonstrated to have good oral bioavailability (57% in the rat) and good oral potency of with an ED<sub>50</sub> of 5mg/kg in that same species. CI-1018 is a relatively weak PDE4 inhibitor with an IC<sub>50</sub> of 1.1µM in U937 cells. CI-1018 has also been identified as, or associated with as closely related in structure to, PD-168787, which in rat studies has been demonstrated to have activity in the inhibition of antigen-induced eosinophilia; Pascal *et al.*, "Synthesis and structure-activity relationships of 4-oxo-1-phenyl-3,4,6,7-tetrahydro-[1,4]-diazepino[6,7,1-hi]indolines: novel PDE4 inhibitors," 215<sup>th</sup> ACS, Dallas, USA, MEDI 50, 1998. Inferred structures for CI-1018 and PD-168787 belong to a diazepinone class whose nucleus may be represented by Formula (0.0.24):

(0.0.24)

The above-mentioned compounds have also been evaluated in animal models which demonstrate their PDE4 inhibition activity. For example, V-11294A, in guinea-pig studies, has been found to be active in the inhibition of antigen-induced bronchoconstriction; Cavalla *et al.*, "Activity of V11294A, a novel phosphodiesterase 4 (PDE4) inhibitor, in cellular and animal models of asthma," *Amer. J. Respir. Crit. Care Med*, 155 A660, 1997. D4418, in guinea-pig studies, has been found to be active in the inhibition of antigen-induced early and late phase bronchoconstriction and BAL eosinophilia; Montana, *et al.*, *Ibid.* CI-1018, in rat studies, has been found to be active in the inhibition of antigen-induced eosinophilia; Burnouf, *et al.*, "Pharmacology of the novel phosphodiesterase Type 4 inhibitor, CI-1018," 215<sup>th</sup> ACS Nat. Meeting, MEDI 008, 1998.

Other compounds which have been advanced in development include CDC-3052, D-22888, YM-58997, and roflumilast, which may be represented by Formulas (0.0.27), (0.0.28), (0.0.29), and (0.0.30), respectively:

CDC-3052  
(0.0.27)

D-22888

(0.0.28)

YM-58977  
(0.0.29)

Roflumilast

(0.0.30)

CDC-3052 has been discontinued from development, but has been succeeded by very potent inhibitors of PDE4 such as the compound represented by Formula (0.0.31), and by the anti-inflammatory compound CDC-801 represented by Formula (0.0.32), respectively:

(0.0.31)

CDC-801

(0.0.32)

The compound of Formula (0.0.32) is reported to have  $IC_{50}$  values of 42 pM and 130 nM as an inhibitor of PDE4 and TNF production, respectively; Muller *et al.*, "N-Phthaloyl beta-aryl-beta-amino derivatives: Potent TNF-alpha and PDE4 inhibitors," 217<sup>th</sup> American Chemical Society, Anaheim, Germany, MEDI 200, 1999; and Muller *et al.*, "Thalidomide analogs and PDE4 inhibition," *Bioorg. Med. Chem. Letts.* 8 2669-2674, 1998.

CDC-801 is from a series of compounds based on thalidomide and has been developed primarily to improve the TNF- $\alpha$  inhibitory activity of thalidomide for the treatment of autoimmune diseases. Thalidomide may be represented by Formula (0.0.33):

Thalidomide

(0.0.33)

5 CDC-801 has also been studied for the treatment of Crohn's disease, a chronic granulomatous inflammatory disease of unknown etiology commonly involving the terminal ileum, with scarring and thickening of the bowel wall which frequently leads to intestinal obstruction and fistula and abscess formation. Crohn's disease has a high rate of recurrence after treatment.

10 YM-58997 has an  $IC_{50}$  value of 1.2 nM against PDE4; Takayama *et al.*, "Synthetic studies on selective Type IV phosphodiesterase (PDE IV) inhibitors," 214<sup>th</sup> American Chemical Society, Las Vegas, USA, MEDI 245, 1997. YM-58997 has a 1,8-naphthyridin-2-one structure, as does YM-976.

15 Roflumilast has been studied for the treatment of both COPD and asthma, and has an  $IC_{50}$  value of 3.5 nM in standard *in vitro* guinea-pig models of asthma. The use of roflumilast and a surfactant for the treatment of adult respiratory distress syndrome (ARDS) has also been described.

20 AWD-12,281, which is now designated as loteprednol, has been shown to be active in a rat model of allergic rhinitis, as described further below in a section which deals with allergic rhinitis and the use of PDE4 inhibitors to treat it. AWD-12,281 may be represented by Formula (0.0.34):

Loteprednol (AWD-12,281)

(0.0.34)

25 Compounds related in structure to CDP840, shown further above as Formula (0.0.9), include L-826,141, which has been reported to have activity in a rat model of bronchitis; Gordon *et al.*, "Anti-inflammatory effects of a PDE4 inhibitor in a rat model of chronic bronchitis," *Am. J. Respir. Crit. Care Med.* 159 A33, 1999. Another such compound is related in structure to those reported in Perrier *et al.*, "Substituted furans as inhibitors of the PDE4 enzyme," *Bioorg. Med. Chem. Letts.* 9 323-326, 1999, and is represented by Formula

30 (0.0.35):

CDP840  
(0.0.9)

(0.0.35)

Other compounds which been found to be very potent PDE4 inhibitors are those represented by Formulas (0.0.36), (0.0.37), and (0.0.38):

(0.0.36)

(0.0.37)

(0.0.38)

Compounds have been created which combine PDE4 and matrix metalloproteinase (MMP) inhibitory activity in a single molecule; Groneberg *et al.*, "Dual inhibition of phosphodiesterase 4 and matrix metalloproteinases by an (arylsulfonyl)hydroxamic acid template," *J. Med. Chem.* 42(4) 541-544, 1999. Two examples of such compounds are represented by Formulas (0.0.39) and (0.0.40):

(0.0.39)

(0.0.40)

The respective IC<sub>50</sub> values for the compounds of Formulas (0.1.36) and (0.1.37) using a guinea-pig macrophage PDE4 assay were 1 nM and 30 nM.

The compounds identified as KF19514 and KF17625 have been shown in guinea-pig studies to have activity in the inhibition of the following: histamine-induced and antigen-induced bronchoconstriction; PAF-induced lung eosinophilia and antigen-induced BAL eosinophilia; acetylcholine (ACh)-induced AHR; PAF-induced BAL eosinophilia and neutrophilia, and AHR; antigen-induced bronchospasm; and anaphylactic

bronchoconstriction; Fujimura *et al.*, "Bronchoprotective effects of KF-19514 and cilostazol in guinea-pigs *in vivo*," *Eur. J. Pharmacol.* **327** 57-63, 1997; Manabe *et al.*, *Ibid.*; Manabe *et al.*, "KF19514, a phosphodiesterase 4 and 1 inhibitor, inhibits PAF-induced lung inflammatory responses by inhaled administration in guinea-pigs," *Int. Arch. Allergy Immunol.* **114** 389-399, 1997; Suzuki *et al.*, "New bronchodilators. 3. Imidazo[4,5-c][1,8]naphthyridin-4(5H)-ones," *J. Med. Chem.* **35** 4866-4874, 1992; Matsuura *et al.*, "Substituted 1,8-naphthyridin-2(1H)-ones as selective phosphodiesterase IV inhibitors," *Biol. Pharm. Bull.* **17**(4) 498-503, 1994; and Manabe *et al.*, "Pharmacological properties of a new bronchodilator, KF17625," *Jpn. J. Pharmacol.* **58**(Suppl. 1) 238P, 1992. KF19514 and KF17625 may be represented by

10 Formulas (0.0.41) and (0.0.42):

KF19514  
(0.0.41)

KF17625  
(0.0.42)

The reported potency and lack of emesis in a series of indandiones suggests that the

15 hypothesis that has related side-effects such as emesis to the ratio of affinity for the PDE4 enzyme relative to that for the high affinity rolipram binding site (HARBS) is erroneous. Such indandiones may be represented by Formulas (0.0.43) and (0.0.44):

R = benzyloxy (0.0.43)

R = [1,4']-piperidiny-1'-carbonyloxy (0.0.44)

The PDE4 inhibitors that have been created heretofore fall into a significant number

20 of different classes in terms of their chemical structures. Such classes have been as diverse as phenanthridines and naphthyridines. One class of PDE4 inhibitors are lignans such as T-440, which has been demonstrated to have activity in the inhibition of the following: early phase bronchoconstriction induced by antigen, histamine, LTD4, U-46619, Ach, neurokinin A, and endothelin-1; allergen-induced early phase and late phase bronchoconstriction and BAL eosinophilia; and ozone-induced AHR and airway epithelial injury. Optimization of the PDE4

inhibitory potency of such compounds has led to the discovery of T-2585, one of the most potent PDE4 inhibitors described to date with an  $IC_{50}$  value of 0.13 nM against guinea-pig lung PDE4. T-440 and T-2585 may be represented by Formulas (0.0.45) and (0.0.46):

T-440  
(0.0.45)

T-2585  
(0.0.46)

Another class of PDE4 inhibitors consists of benzofurans and benzothiophenes. In particular, furan and chroman rings have been utilized as surrogates for the cyclopentylether of the rolipram pharmacophore. An example of such a compound is one that is apparently related in structure to BAY 19-8004, and which may be represented by Formula (0.0.47):

(0.0.47)

Another benzofuran-type compound has been reported to have an  $IC_{50}$  value of 2.5 nM, and may be represented by Formula (0.0.48):

(0.0.48)

A compound with a related structure, which is not, however, a benzofuran, is characterized by a fused dioxicin ring and is reported to produce almost complete inhibition of canine tracheal PDE4 at 100 nM. This compound may be represented by Formula (0.0.49):

(0.0.49)

Quinolines and quinolones are a further class of PDE4 inhibitor structures, and they serve as surrogates for the catechol moiety of rolipram. This compound and two compounds of similar structure may be represented by Formulas (0.0.50), (0.0.51), and (0.0.52):

(0.0.50)

(0.0.51)

(0.0.52)

Purines, xanthines, and pteridines represent yet further classes of chemical compounds to which PDE4 inhibitors described heretofore in the art belong. The compound V-11294A described further above and represented by Formula (0.0.22), is a purine. A PDE4 inhibitor which is a xanthine compound, the class of compounds to which theophylline belongs, has been described in the art; Montana *et al.*, "PDE4 inhibitors, new xanthine analogues," *Bioorg. Med. Chem. Letts.* 8 2925-2930, 1998. The xanthine compound may be represented by Formula (0.0.54):

(0.0.54)

A potent PDE4 inhibitor belonging to the pteridine class of compounds has been demonstrated to have an  $IC_{50}$  value of 16 nM against a PDE4 derived from tumor cells and to inhibit the growth of tumor cells at micromolar concentrations; Merz *et al.*, "Synthesis of 7-

Benzylamino-6-chloro-2-piperazino-4-pyrrolidinopteridine and novel derivatives free of positional isomers. Potent inhibitors of cAMP-specific phosphodiesterase and of malignant tumor cell growth," *J. Med. Chem.* 41(24) 4733-4743, 1998. The pteridine PDE4 inhibitor may be represented by Formula (0.0.55):

(0.0.55)

5

Triazines represent a still further class of chemical compounds to which PDE4 inhibitors belong that have been described in the art heretofore. Two such triazines have been described which display bronchodilator activity and are potent relaxant agents in a guinea-pig trachea model. These compounds, which may be represented by Formulas (0.0.56) and (0.0.57) below, are also moderately potent PDE4 inhibitors with IC<sub>50</sub> values of 150 and 140 nM, respectively:

10

(0.0.56)

(0.0.57)

15

A triazine having a structure assumed to be closely related to that of the compounds of Formulas (0.0.56) and (0.0.57) is UCB-29936, which has been demonstrated to have activity in a murine model of septic shock; Danhaive *et al.*, "UCB29936, a selective phosphodiesterase Type IV inhibitor: therapeutic potential in endotoxic shock," *Am. J. Respir. Crit. Care. Med.* 159 A611, 1999.

20

Efforts have also been made in the art to improve the selectivity of PDE4 inhibitors with respect to the A through D subtypes described further above. There are presently four known isoforms (subtypes) of the PDE4 isozyme, encompassing seven splice variants, also described further above. The PDE4D isoform mRNA is expressed in inflammatory cells such as neutrophils and eosinophils, and it has been suggested in the art that D-selective inhibitors of PDE4 will provide good clinical efficacy with reduced side-effects. A nicotinamide derivative displaying selectivity for inhibition of the PDE4D isoform has been described; WO 98/45268; as well as a naphthyridine derivative reported to be a PDE4D selective inhibitor;

25

WO 98/18796. These compounds may be represented by Formulas (0.0.58) and (0.0.59), respectively:

5 Another nicotinamide compound has been described in the art which may be useful in the treatment of CNS diseases such as multiple sclerosis; GB-2327675; and a rolipram derivative has been described in the art which is a PDE4 inhibitor which binds with equal affinity to both the catalytic and the HARB sites on human PDE4B2B; Tian *et al.*, "Dual inhibition of human Type 4 phosphodiesterase isozymes by (*R,R*)-(+/-)-methyl-3-acetyl-4-[3-(cyclopentyloxy)-4-methoxyphenyl]-3-methyl-1-pyrrolidine carboxylate," *Biochemistry* 37(19) 6894-6904, 1998. The nicotinamide derivative and the rolipram derivative may be represented by Formulas (0.0.60) and (0.0.61), respectively:

15 Further background information concerning selective PDE4 isozymes may be found in publications available in the art, e.g., Norman, "PDE4 inhibitors 1999," *Exp. Opin. Ther. Patents* 9(8) 1101-1118, 1999 (Ashley Publications Ltd.); and Dyke and Montana, "The therapeutic potential of PDE4 inhibitors," *Exp. Opin. Invest. Drugs* 8(9) 1301-1325, 1999 (Ashley Publications Ltd.).

20

### 3.0 DESCRIPTION OF THE STATE OF THE ART

WO 98/45268 (Marfat *et al.*), published October 15, 1998, discloses nicotinamide derivatives having activity as selective inhibitors of PDE4D isozyme. These selective inhibitors are represented by Formula (0.1.1):

(0.1.1)

US 4,861,891 (Saccomano *et al.*), issued August 29, 1989, discloses nicotinamide compounds which function as calcium independent c-AMP phosphodiesterase inhibitors useful as antidepressants, of Formula (0.1.2):

(0.1.2)

The nicotinamide nucleus of a typical compound disclosed in this patent is bonded directly to the R<sup>1</sup> group, which is defined as 1-piperidyl, 1-(3-indolyl)ethyl, C<sub>1</sub>-C<sub>4</sub> alkyl, phenyl, 1-(1-phenylethyl), or benzyl optionally mono-substituted by methyl, methoxy, chloro or fluoro. The R<sup>2</sup> substituent is bicyclo[2.2.1]hept-2-yl or

where Y is H, F or Cl; and X is H, F, Cl, OCH<sub>3</sub>, CF<sub>3</sub>, CN, COOH, -C(=O)(C<sub>1</sub>-C<sub>4</sub>) alkoxy, NH(CH<sub>3</sub>)C(=O)- (methylcarbamoyl) or N(CH<sub>3</sub>)<sub>2</sub>C(=O)- (dimethylcarbamoyl).

US 4,692,185 (Michaely *et al.*) discloses herbicides such as those of Formula (0.1.3):

(0.1.3)

where R is (C<sub>1</sub>-C<sub>4</sub>) alkyl, (C<sub>1</sub>-C<sub>4</sub>) haloalkyl, or halo.

EP 550 900 (Jeschke *et al.*) discloses herbicides and plant nematocides of Formula (0.1.4):

- 21 -

(0.1.4)

- where n is 0-3; R¹ is selected from numerous groups, but is usually H, 6-CH₃, or 5-Cl; R² is alkyl, alkenyl, alkynyl, cycloalkyl, aryl or aralkyl; R¹ and R² is halo, CN, NO₂, alkyl, haloalkyl, alkoxy, haloalkoxy, alkylthio, haloalkylthio, alkylsulfonyl, haloalkylsulfonyl, aryl, aryloxy, or arylthio; and R⁴ is alkyl.

EP 500 989 (Mollner *et al.*) discloses ACE inhibitors of Formula (0.1.5):

(0.1.5)

- 10 where n is 0-3; R is OH, SH, COOH, NH₂, halo, OR₄, SR₄, COOR₄, NHR₄ or N(R₄)₂, where R₄ is lower alkyl, optionally substituted aryl, or acyl; R₁ is OH, lower alkoxy, optionally substituted aryl lower alkoxy, aryloxy, or disubstituted amino; R₂ is lower alkyl or amino lower alkyl; and R¹ and R² is halo, NO₂, lower alkyl, halo lower alkyl, aryl lower alkyl, or aryl. Specific embodiments disclosed include compounds such as that of Formula (0.1.6):

15

(0.1.6)

FR 2.140.772 (Aries) discloses compounds asserted to have utility as analgesics, tranquilizers, antipyretics, anti-inflammatories, and antirheumatics, of Formula (0.1.7):

20

(0.1.7)

where R is 1 or 2 substituents chosen from lower alkyl, trihalomethyl, alkoxy, and halo; R' is H or alkyl; and R'' is hydrogen or alkyl.

JP 07 304775 (Otsuka *et al.*) discloses naphthyridine and pyridopyrazine derivatives which have anti-inflammatory, immunomodulating, analgesic, antipyretic, antiallergic, and antidepressive action. Also disclosed are intermediates of Formula (0.1.8):

(0.1.8)

where X may be CH, and R and R' are each lower alkyl.

With regard to the disclosures of the above-identified patents and published patent applications, it will be appreciated that only the disclosure of WO 98/45268 (Marfat *et al.*) concerns the inhibition of PDE4 isozymes. The state of the art also contains information regarding compounds wholly dissimilar in chemical structure to those of Formula (1.0.0) of the present invention, but which, on the other hand, possess biological activity similar to that of the compounds of Formula (1.0.0). Representative patents and published patent applications disclosing said information are illustrated further below.

US 5,552,438; US 5,602,157; and US 5,614,540 (all to Christensen), which all share the same April 2, 1992 priority date, relate to a therapeutic agent identified as ARIFLO®, which is a compound of Formula (0.1.9) and named as indicated below:

ARIFLO®

cis-[4-cyano-4-(3-cyclopentyl-oxy-4-methoxyphenyl)cyclo-hexane-1-carboxylic acid]

(0.1.9)

The compound of Formula (0.1.9) falls within the scope of US 5,552,438 which discloses a genus of compounds of Formula (0.1.10):

(0.1.10)

where R<sub>1</sub> = -(CR<sub>4</sub>R<sub>5</sub>)<sub>r</sub>R<sub>6</sub> where r = 0 and R<sub>6</sub> = C<sub>3-6</sub> cycloalkyl; X = YR<sub>2</sub> where Y = O and R<sub>2</sub> = -CH<sub>3</sub>; X<sub>2</sub> = O; X<sub>3</sub> = H; and X<sub>4</sub> = a moiety of partial Formula (0.1.10.1)

- 23 -

(0.1.10.1)

where X<sub>s</sub> = H; s = 0; R<sub>1</sub> and R<sub>2</sub> = CN; and Z = C(O)OR<sub>14</sub> where R<sub>14</sub> = H. The disclosures of US 5,602,157 and US 5,614,540 differ from that of US 5,552,438 and each other as to the definition of the R<sub>3</sub> group, which in the case of the ARIFLO® compound, is CN. A preferred salt form of the ARIFLO® compound is disclosed to be the tris(hydroxymethyl)ammonium methane salt.

US 5,863,926 (Christensen *et al.*) discloses analogs of the ARIFLO® compound, e.g., that of Formula (0.1.11):

(0.1.11)

10

WO 99/18793 (Webb *et al.*) discloses a process of making the ARIFLO® and related compounds. WO 95/00139 (Barnette *et al.*) claims a compound which has an IC<sub>50</sub> ratio of about 0.1 or greater as regards the IC<sub>50</sub> for the PDE IV catalytic form which binds rolipram with a high affinity, divided by the IC<sub>50</sub> for the form which binds rolipram with a low affinity; but in a dependent claim restricts the scope thereof to a compound which was not known to be a PDE4 inhibitor prior to June 21, 1993.

15

WO 99/20625 (Eggleston) discloses crystalline polymorphic forms of cipamfylline for treatment of PDE<sub>4</sub> and TNF mediated diseases, of Formula (0.1.12):

Cipamfylline

(0.1.12)

20

WO 99/20280 (Griswold *et al.*) discloses a method of treating pruritis by administering an effective amount of a PDE4 inhibitor, e.g., a compound of Formula (0.1.13):

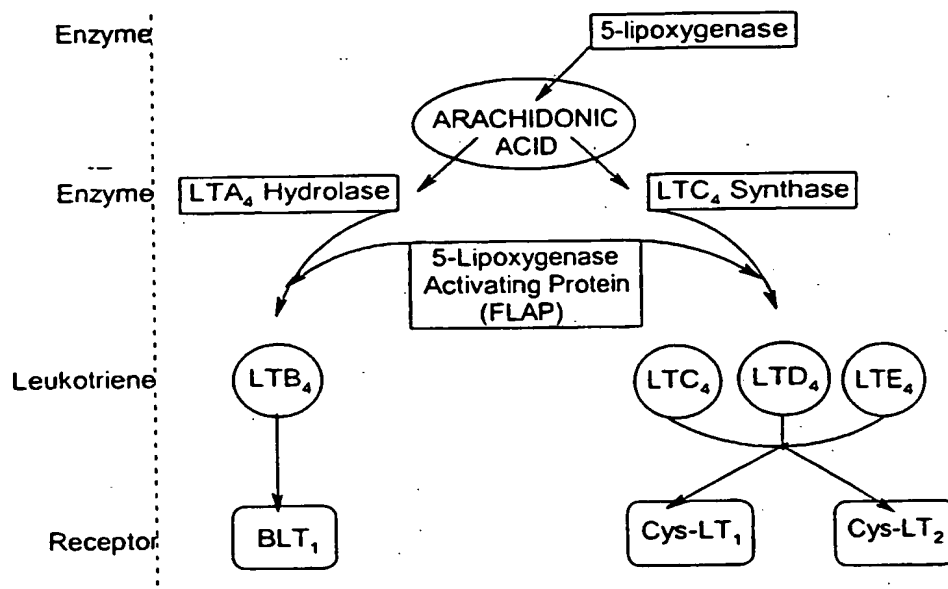

(0.1.13)

US 5,922,557 (Pon) discloses a CHO-K1 cell line which stably expresses high levels of a full length low-Km cAMP specific PDE4A enzyme, which has, in turn, been used to  
5 examine potent PDE4 enzyme inhibitors and compare the rank order of their potencies in elevating cAMP in a whole-cell preparation with their ability to inhibit phosphodiesterase activity in a broken-cell preparation. It is further said to be found that the soluble enzyme inhibition assay described in the prior art does not reflect behavior of the inhibitors acting *in vivo*. An improved soluble enzyme whole-cell assay is then disclosed which is said to reflect  
10 the behavior of inhibitors acting *in vivo*. It is further disclosed that there exist at least four distinct PDE4 isoforms or subtypes, and that each subtype has been shown to give rise to a number of splice variants, which in themselves can exhibit different cellular localization and affinities for inhibitors.

With regard to the disclosures of the above-identified patents and published patent  
15 applications, it will be appreciated that the compounds involved possess the same biological activity as the compounds of Formula (1.0.0). At the same time, however, the artisan will observe that the chemical structures of said compounds disclosed in the prior art are not only diverse from each other but dissimilar to that of the novel compounds of the present invention as well. The state of the art contains still further information regarding compounds which are  
20 dissimilar in chemical structure to those of Formula (1.0.0), and which, moreover, do not possess PDE4 inhibitory activity similar to that of the compounds of Formula (1.0.0). Such compounds disclosed in the prior art do, nevertheless, often have therapeutic utility similar to that possessed by the compounds of Formula (1.0.0), *i.e.*, in the treatment of inflammatory, respiratory and allergic diseases and conditions. In particular this is applicable to certain  
25 inhibitors of enzymes and antagonists of receptors in the so-called leukotriene pathway. This is especially the case with regard to the leukotrienes LTB<sub>4</sub> and LTD<sub>4</sub>. Accordingly, representative patents and published patent applications disclosing further information of this type are described below.

Arachidonic acid is metabolized by cyclooxygenase-1 and by 5-lipoxygenase. The 5-  
30 lipoxygenase pathway leads to the production of leukotrienes (LTs) which contribute to the inflammatory response through their effect on neutrophil aggregation, degranulation and chemotaxis; vascular permeability; smooth muscle contractility; and on lymphocytes. The

cysteinyl leukotrienes,  $\text{LTC}_4$ ,  $\text{LTD}_4$ , and  $\text{LTE}_4$ , play an important role in the pathogenesis of asthma. The components of the leukotriene pathway which afford targets for therapeutic intervention are illustrated in the following diagram:

- 5 Accordingly, agents which are able to intervene in any of the steps of the 5-lipoxygenase pathway afford an opportunity for therapeutic treatment. An example of one such agent is the 5-lipoxygenase inhibitor, zileuton, a therapeutic agent identified as ZYFLO® which may be represented by Formula (0.1.14):

ZYFLO®

Zileuton

(0.1.14)

10

Another such agent is the  $\text{LTD}_4$  receptor antagonist zafirlukast, a therapeutic agent identified as ACCOLATE® which may be represented by Formula (0.1.15):

- 26 -

ACCOLATE®

Zafirlukast

(0.1.15)

A further such LTD<sub>4</sub> receptor antagonist is montelukast, a therapeutic agent identified  
 5 as SINGULAIR® which may be represented by Formula (0.1.16):

SINGULAIR®

Montelukast

(0.1.16)

Another type of the above-mentioned therapeutic targets is the LTB<sub>4</sub> receptor, and an  
 10 example of an antagonist for said receptor is BIIL-260, a therapeutic agent which may be  
 represented by Formula (0.1.17):

BIIL-260

(0.1.17)

Another example of a therapeutic agent which is an LTB<sub>4</sub> receptor antagonist is CGS-  
 15 25019c which may be represented by Formula (0.1.18):

- 27 -

CGS-25019c

(0.1.18)

Nothing in the above-described state of the art discloses or would suggest to the artisan the novel compounds of the present invention or their PDE4 inhibitory activity and the resulting significant improvement in therapeutic utility and therapeutic index in the treatment of inflammatory, respiratory and allergic diseases and conditions.

#### 4.0 SUMMARY OF THE INVENTION

The present invention is concerned with novel compounds which have biological activity as inhibitors of the phosphodiesterase so-called "Type IV" isoenzyme ("PDE4 isozyme"). Embodiments of the novel compounds of the present invention are active as non-selective inhibitors of the PDE4 isozyme. Other embodiments of said novel compounds have PDE4 isozyme substrate specificity, especially for the D subtype. Said novel compounds having non-selective or D-selective PDE4 inhibitor activity are generally useful in the therapeutic treatment of various inflammatory, allergic, and respiratory diseases and conditions, and they afford in particular a significant improvement in the therapeutic treatment of obstructive respiratory diseases, especially asthma and chronic obstructive pulmonary disease (COPD).

The present invention relates to a compound of Formula (1.0.0):

(1.0.0)

- wherein -

-m is 0, 1, or 2;

-n is 1 or 2;

- 28 -

-W is  $-\text{O}-$ ;  $-\text{S}(=\text{O})_t-$ , where  $t$  is 0, 1, or 2; or  $-\text{N}(\text{R}^3)-$ , where  $\text{R}^3$  has the same meaning as defined below;

-Y is  $=\text{C}(\text{R}^E)-$ ; or  $-\text{N}=\text{O}-$ ;

- where -

5  $-\text{R}^E$  is a member selected from the group consisting of  $-\text{H}$ ;  $-\text{F}$ ;  $-\text{Cl}$ ;  $-\text{CN}$ ;  $-\text{NO}_2$ ;  $-(\text{C}_1-\text{C}_4)$  alkyl;  $(\text{C}_2-\text{C}_4)$  alkynyl; fluorinated- $(\text{C}_1-\text{C}_3)$  alkyl;  $(\text{C}_1-\text{C}_3)$  alkoxy; fluorinated- $(\text{C}_1-\text{C}_3)$  alkoxy;  $-\text{OH}$ ; and  $-\text{C}(=\text{O})\text{NH}_2$ ;

10  $-\text{R}^A$  and  $\text{R}^B$  are each a member independently selected from the group consisting of  $-\text{H}$ ;  $-\text{F}$ ;  $-\text{CF}_3$ ;  $-(\text{C}_1-\text{C}_6)$  alkyl;  $-(\text{C}_3-\text{C}_7)$  cycloalkyl; phenyl; benzyl; and a heterocyclic moiety selected from the group consisting of pyrrolyl; pyrazolyl; imidazolyl; pyridinyl; pyrazinyl; pyrimidinyl; pyridazinyl; oxazolyl; oxazolidinyl; *iso*-oxazolyl; thiazolyl; thiazolidinyl; *iso*-thiazolyl; triazolyl; tetrazolyl; oxadiazolyl; and thiadiazolyl; wherein said alkyl, cycloalkyl, phenyl, benzyl, or heterocyclic moiety is each independently substituted with 0 to 3 substituents  $\text{R}^{10}$ ;

15 — provided that —

for the above and all other applicable meanings of  $\text{R}^A$  and  $\text{R}^B$ , when  $\text{R}^{10}$  as a substituent of  $\text{R}^A$  or  $\text{R}^B$  has the meaning of  $-\text{OR}^{12}$ ,  $-\text{O}-\text{C}(=\text{O})\text{R}^{13}$ , or  $-\text{OC}(=\text{O})\text{NR}^{12}\text{R}^{13}$ , the positional relationship of said  $-\text{OR}^{12}$ ,  $-\text{O}-\text{C}(=\text{O})\text{R}^{13}$ , or  $-\text{OC}(=\text{O})\text{NR}^{12}\text{R}^{13}$  to  $-\text{OR}^{12}$  as a meaning of  $\text{Z}$ , is other than a vicinal one;

20 - where -

$-\text{R}^{10}$  is a member selected from the group consisting of  $-\text{F}$ ;  $-\text{Cl}$ ;  $-\text{CF}_3$ ;  $-\text{CN}$ ;  $(\text{C}_1-\text{C}_2)$  alkyl;  $-\text{OR}^{12}$ ;  $-\text{C}(=\text{O})\text{OR}^{12}$ ;  $-\text{O}-\text{C}(=\text{O})\text{R}^{13}$ ;  $-\text{C}(=\text{O})\text{NR}^{12}\text{R}^{13}$ ;  $-\text{O}-\text{C}(=\text{O})\text{NR}^{12}\text{R}^{13}$ ;  $-\text{NR}^{12}\text{R}^{13}$ ;  $-\text{NR}^{12}\text{C}(=\text{O})\text{R}^{13}$ ;  $-\text{NR}^{12}\text{C}(=\text{O})\text{OR}^{13}$ ;  $-\text{NR}^{12}\text{S}(=\text{O})_2\text{R}^{13}$ ; and  $-\text{S}(=\text{O})_2\text{NR}^{12}\text{R}^{13}$ ;

- where -

25  $-\text{R}^{12}$  and  $\text{R}^{13}$  are each a member independently selected from the group consisting of  $-\text{H}$ ;  $-(\text{C}_1-\text{C}_4)$  alkyl;  $(\text{C}_2-\text{C}_4)$  alkenyl;  $(\text{C}_3-\text{C}_6)$  cycloalkyl; phenyl; benzyl; and a monocyclic heterocyclic moiety comprising  $(\text{C}_3-\text{C}_6)$  cycloalkyl wherein a nitrogen heteroatom replaces one carbon atom, and optionally a second nitrogen heteroatom replaces a second carbon atom of a 5- or 6-membered said heterocyclic moiety, and further optionally wherein an oxygen heteroatom replaces a third carbon atom of a 5- or 6-membered said heterocyclic moiety; wherein said alkyl, alkenyl, cycloalkyl, phenyl, benzyl, or monocyclic heterocyclic moiety is substituted by 0 to 3 substituents selected from the group consisting of F and Cl;

30

- 29 -

- or -

$-R^A$  and  $R^B$  are taken together, provided that  $m$  is 1, to form a spiro moiety of Formula (1.1.0):

(1.1.0)

5

- where -

$-r$  and  $s$  are independently 0 to 4 provided that the sum of  $r + s$  is at least 1 but not greater than 5;

- and -

10  $-Q^A$  is selected from  $-CH_2-$ ,  $-CHF$ ,  $-CF_2$ ,  $-NR^{12}-$ ,  $-O-$ ; and  $-S(=O)_t-$ , where  $t$  is 0, 1, or 2; and said spiro moiety is substituted as to any one or more carbon atoms thereof, including the carbon atom of the group  $-CH_2-$  defining  $Q^A$ , by 0 to 3 substituents  $R^{10}$ , where  $R^{10}$  and  $R^{12}$  have the same meanings as defined above; provided that for the above and all other meanings of  $R^A$  and  $R^B$ , when  $R^{10}$  as a substituent of  $R^A$  or  $R^B$  has the meaning of  
 15  $-OR^{12}$ ,  $-O-C(=O)R^{13}$ , or  $-OC(=O)NR^{12}R^{13}$ , the positional relationship of said  $-OR^{12}$ ,  $-O-C(=O)R^{13}$ , or  $-OC(=O)NR^{12}R^{13}$  to  $-OR^{12}$  as a meaning of  $Z$ , is other than a vicinal one;

$-R^C$  and  $R^D$  have the same meaning as defined above for  $R^A$  and  $R^B$ , except that at least one of  $R^C$  and  $R^D$  must be  $-H$ , and they are selected independently of each other and of  $R^A$  and  $R^B$ ;

20  $-Q$  is phenyl; pyrrolyl; furanyl; thienyl; pyridyl; pyrimidinyl; imidazolyl; thiazolyl; oxazolyl; a monocyclic  $-(C_5-C_7)$  cycloalkyl moiety; a monocyclic  $-(C_5-C_7)$  cycloalkenyl moiety that is a member selected from the group consisting of cyclopentenyl, cyclohexenyl, and cycloheptenyl; or a bicyclic  $-(C_7-C_{10})$  cycloalkyl or  $-(C_7-C_{10})$  cycloalkenyl moiety, preferably one that is a member selected from the group consisting of norbornanyl, norbornenyl,  
 25 bicyclo[2.2.2]octanyl, bicyclo[3.2.1]octanyl, bicyclo[3.3.0]octanyl, bicyclo[2.2.2]oct-5-enyl, bicyclo[2.2.2]oct-7-enyl, bicyclo[3.3.1]nonanyl, and adamantanyl;

$-R^1$  and  $R^2$  are each a member independently selected from the group consisting of  $-H$ ;  $-F$ ;  $-Cl$ ;  $-R^{12}$ ;  $-OR^{12}$ ;  $-S(=O)_pR^{12}$ ;  $-C(=O)OR^{12}$ ;  $-OC(=O)R^{12}$ ;  $-CN$ ;  $-NO_2$ ;  $-C(=O)NR^{12}R^{13}$ ;  $-OC(=O)NR^{12}R^{13}$ ;  $-NR^{14}C(=O)NR^{15}R^{12}$ ;  $-NR^{14}C(=NR^{14})NR^{15}R^{12}$ ;  
 30  $-NR^{14}C(=NCN)NR^{15}R^{12}$ ;  $-NR^{14}C(=N-NO_2)NR^{15}R^{12}$ ;  $-C(=NR^{14})NR^{15}R^{12}$ ;  $-OC(=NR^{14})NR^{15}R^{12}$ ;

- 30 -

$-\text{OC}(=\text{N}-\text{NO}_2)\text{NR}^{15}\text{R}^{12}$ ;  $-\text{NR}^{15}\text{R}^{12}$ ;  $-\text{CH}_2\text{NR}^{15}\text{R}^{12}$ ;  $-\text{NR}^{14}\text{C}(=\text{O})\text{R}^{12}$ ;  $-\text{NR}^{14}\text{C}(=\text{O})\text{OR}^{12}$ ;  $-\text{NR}^{14}\text{S}(=\text{O})_p\text{R}^{13}$ ; and  $-\text{S}(=\text{O})_p\text{NR}^{12}\text{R}^{13}$ ; where  $p$  is 0, 1, or 2;  $\text{R}^{12}$  and  $\text{R}^{13}$  have the same meanings as defined above; and  $\text{R}^{14}$  and  $\text{R}^{15}$  have the same meanings as defined below;

$-\text{R}^3$  is  $-\text{H}$ ;  $-(\text{C}_1-\text{C}_3)$  alkyl;  $-(\text{C}_1-\text{C}_3)$  alkoxy;  $-\text{OH}$ ; phenyl; or benzyl;

5  $-\text{R}^4$  is a member independently selected from the group consisting of

– the following –

10 (a)  $-\text{H}$ ;  $-\text{F}$ ;  $-\text{Cl}$ ;  $-(\text{C}_2-\text{C}_4)$  alkynyl;  $-\text{R}^{12}$ ;  $-\text{OR}^{12}$ ;  $-\text{S}(=\text{O})_p\text{R}^{12}$ ;  $-\text{C}(=\text{O})\text{OR}^{12}$ ;  $-\text{OC}(=\text{O})\text{R}^{12}$ ;  $-\text{CN}$ ;  $-\text{NO}_2$ ;  $-\text{C}(=\text{O})\text{NR}^{15}\text{R}^{12}$ ;  $-\text{OC}(=\text{O})\text{NR}^{15}\text{R}^{12}$ ;  $-\text{NR}^{14}\text{C}(=\text{O})\text{NR}^{15}\text{R}^{12}$ ;  $-\text{NR}^{14}\text{C}(=\text{NR}^{14})\text{NR}^{15}\text{R}^{12}$ ;  $-\text{NR}^{14}\text{C}(=\text{NCN})\text{NR}^{15}\text{R}^{12}$ ;  $-\text{NR}^{14}\text{C}(=\text{N}-\text{NO}_2)\text{NR}^{15}\text{R}^{12}$ ;  $-\text{C}(=\text{NR}^{14})\text{NR}^{15}\text{R}^{12}$ ;  $-\text{OC}(=\text{NR}^{14})\text{NR}^{15}\text{R}^{12}$ ;  $-\text{OC}(=\text{N}-\text{NO}_2)\text{NR}^{15}\text{R}^{12}$ ;  $-\text{NR}^{15}\text{R}^{12}$ ;  $-\text{CH}_2\text{NR}^{15}\text{R}^{12}$ ;  $-\text{NR}^{14}\text{C}(=\text{O})\text{R}^{12}$ ;  $-\text{NR}^{14}\text{C}(=\text{O})\text{OR}^{12}$ ;  $-\text{NR}^{14}\text{S}(=\text{O})_p\text{R}^{15}$ ;  $-\text{S}(=\text{O})_p\text{NR}^{15}\text{R}^{12}$ ; and  $-\text{CH}_2\text{C}(=\text{NR}^{14})\text{NR}^{15}\text{R}^{12}$ ; where  $p$  is 0, 1, or 2; and  $\text{R}^{12}$  has the same meaning as defined above;

– where –

15  $-\text{R}^{14}$  is selected from the group consisting of  $-\text{H}$ ;  $-\text{CH}_3$ ; and  $-\text{CH}_2\text{CH}_3$ ;

$-\text{R}^{15}$  is a member independently selected from the group consisting of  $-\text{H}$ ;  $-\text{C}(=\text{O})\text{OR}^{12}$ ;  $-\text{C}(=\text{O})\text{NR}^{12}\text{R}^{13}$ ;  $-(\text{C}_1-\text{C}_4)$  alkyl;  $-(\text{C}_2-\text{C}_4)$  alkenyl;  $-(\text{C}_1-\text{C}_2)$  alkoxy;  $-(\text{C}_3-\text{C}_7)$  cycloalkyl; and phenyl; where  $\text{R}^{12}$  and  $\text{R}^{13}$  have the same meaning as defined above; and said alkyl, alkenyl, alkoxy, cycloalkyl and phenyl are substituted with 0 to 2 substituents  $\text{R}^{21}$ ;

– where –

25  $-\text{R}^{21}$  is a member independently selected from the group consisting of  $-\text{F}$ ;  $-\text{Cl}$ ;  $-\text{C}(=\text{O})\text{OR}^{23}$  where  $\text{R}^{23}$  and  $\text{R}^{24}$  have the same meanings as defined below;  $-\text{OH}$ ;  $-\text{CN}$ ;  $-\text{C}(=\text{O})\text{NR}^{23}\text{R}^{24}$ ;  $-\text{NR}^{23}\text{R}^{24}$ ;  $-\text{NR}^{23}\text{C}(=\text{O})\text{R}^{24}$ ;  $-\text{NR}^{23}\text{C}(=\text{O})\text{OR}^{24}$ ;  $-\text{NR}^{23}\text{S}(=\text{O})_p\text{R}^{24}$  and  $-\text{S}(=\text{O})_p\text{NR}^{23}\text{R}^{24}$ , where  $p$  has the same meaning as defined above;  $-(\text{C}_1-\text{C}_4)$  alkyl including dimethyl; and  $-(\text{C}_1-\text{C}_4)$  alkoxy; wherein said alkyl and alkoxy are each independently substituted with 0 to 3 substituents independently selected from  $-\text{F}$  and  $-\text{Cl}$ ;  $-(\text{C}_1-\text{C}_2)$  alkoxycarbonyl;  $-(\text{C}_1-\text{C}_2)$  alkylcarbonyl; and  $-(\text{C}_1-\text{C}_2)$  alkylcarbonyloxy;

– where –

30  $-\text{R}^{23}$  and  $\text{R}^{24}$  are each independently  $-\text{H}$ ; or  $-(\text{C}_1-\text{C}_2)$  alkyl;

– and further  $\text{R}^4$  –

- 31 -

-(b) is independently selected from  $-(C_1-C_4)$  alkyl; and  $-(C_1-C_4)$  alkoxy wherein said alkyl and alkoxy are each independently substituted with 0 to 3 substituents  $-F$  or  $-Cl$ ; or 0 or 1 substituent  $(C_1-C_2)$  alkoxycarbonyl-;  $(C_1-C_2)$  alkylcarbonyl-; or  $(C_1-C_2)$  alkylcarbonyloxy-;

5

- and still further  $R^4$  -

-(c) is independently selected from an aryl or heterocyclic moiety selected from the group consisting of phenyl; benzyl; furyl; tetrahydrofuranyl; oxetanyl; thienyl; tetrahydrothienyl; pyrrolyl; pyrrolidinyl; oxazolyl; oxazolidinyl; isoxazolyl; isoxazolidinyl; thiazolyl; thiazolidinyl; isothiazolyl; isothiazolidinyl; pyrazolyl; pyrazolidinyl; oxadiazolyl; thiadiazolyl; imidazolyl; imidazolidinyl; pyridinyl; pyrazinyl; pyrimidinyl; pyridazinyl; piperidinyl; piperazinyl; triazolyl; triazinyl; tetrazolyl; pyranyl; azetidyl; morpholinyl; parathiazinyl; indolyl; indolinyl; benzo[b]furanyl; 2,3-dihydrobenzofuranyl; 2-*H*-chromenyl; chromanyl; benzothienyl; 1-*H*-indazolyl; benzimidazolyl; benzoxazolyl; benzisoxazolyl; benzthiazolyl; quinolinyl; isoquinolinyl; phthalazinyl; quinazolinyl; quinoxalinyl; and purinyl;

15

- wherein -

said alkyl, alkoxy, aryl and heterocyclic moieties are each independently substituted with 0 to 3 substituents  $R^{10}$  where  $R^{10}$  has the same meaning as defined above;

$-R^5$  and  $R^6$  are taken together to form a moiety which is a member selected from the group consisting of partial Formulas (1.1.1) through (1.1.5):

20

(1.1.1)

(1.1.2)

(1.1.3)

(1.1.4)

(1.1.5)

- wherein -

$-R^7$  and  $R^8$  are each independently  $-H$ ;  $-CH_3$ ;  $-OR^{14}$  where  $R^{14}$  has the same meaning as defined above; or absent, in which case the dashed line  $- - -$  represents a double bond;

25

- and -

$-Z$  is independently selected from the group consisting of  $-OR^{12}$ ;  $-C(=O)R^{12}$ ; and  $-CN$ ; where  $R^{12}$  has the same meaning as defined above;

- 32 -

- or -

a pharmaceutically acceptable salt thereof.

The present invention is further concerned with a method of treating a subject suffering from a disease or condition mediated by the PDE4 isozyme in its role of regulating the activation and degranulation of human eosinophils, comprising administering to said  
5 subject in need of said treatment a therapeutically effective amount of a compound of Formula (1.0.0) as described above. Similarly, the present invention is also concerned with a pharmaceutical composition for use in such a therapeutic treatment, comprising a compound of Formula (1.0.0) as described above together with a pharmaceutically acceptable carrier.

10 The present invention relates to PDE4 isozyme inhibitors comprising a compound of Formula (1.0.0) as described above which is useful in treating or preventing one or members selected from the groups of diseases, disorders, and conditions consisting of:

- 15 - asthma of whatever type, etiology, or pathogenesis; or asthma that is a member selected from the group consisting of atopic asthma; non-atopic asthma; allergic asthma; atopic, bronchial, IgE-mediated asthma; bronchial asthma; essential asthma; true asthma; intrinsic asthma caused by pathophysiologic disturbances; extrinsic asthma caused by environmental factors; essential asthma of unknown or inapparent cause; non-atopic asthma; bronchitic asthma; emphysematous asthma; exercise-induced asthma; occupational asthma; infective asthma caused by bacterial, fungal, protozoal, or viral  
20 infection; non-allergic asthma; incipient asthma; wheezy infant syndrome;
- chronic or acute bronchoconstriction; chronic bronchitis; small airways obstruction; and emphysema;
- obstructive or inflammatory airways diseases of whatever type, etiology, or pathogenesis; or an obstructive or inflammatory airways disease that is a member selected from the group  
25 consisting of asthma; pneumoconiosis; chronic eosinophilic pneumonia; chronic obstructive pulmonary disease (COPD); COPD that includes chronic bronchitis, pulmonary emphysema or dyspnea associated therewith; COPD that is characterized by irreversible, progressive airways obstruction; adult respiratory distress syndrome (ARDS), and exacerbation of airways hyper-reactivity consequent to other drug therapy;
- 30 - pneumoconiosis of whatever type, etiology, or pathogenesis; or pneumoconiosis that is a member selected from the group consisting of aluminosis or bauxite workers' disease; anthracosis or miners' asthma; asbestosis or steam-fitters' asthma; chalicosis or flint disease; ptilosis caused by inhaling the dust from ostrich feathers; siderosis caused by the inhalation of iron particles; silicosis or grinders' disease; byssinosis or cotton-dust asthma;  
35 and talc pneumoconiosis;

- 5      - bronchitis of whatever type, etiology, or pathogenesis; or bronchitis that is a member selected from the group consisting of acute bronchitis; acute laryngotracheal bronchitis; arachidic bronchitis; catarrhal bronchitis; croupus bronchitis; dry bronchitis; infectious asthmatic bronchitis; productive bronchitis; staphylococcus or streptococcal bronchitis; and vesicular bronchitis;
- 10     - bronchiectasis of whatever type, etiology, or pathogenesis; or bronchiectasis that is a member selected from the group consisting of cylindric bronchiectasis; sacculated bronchiectasis; fusiform bronchiectasis; capillary bronchiectasis; cystic bronchiectasis; dry bronchiectasis; and follicular bronchiectasis;
- 15     - seasonal allergic rhinitis; or perennial allergic rhinitis; or sinusitis of whatever type, etiology, or pathogenesis; or sinusitis that is a member selected from the group consisting of purulent or nonpurulent sinusitis; acute or chronic sinusitis; and ethmoid, frontal, maxillary, or sphenoid sinusitis;
- 20     - rheumatoid arthritis of whatever type, etiology, or pathogenesis; or rheumatoid arthritis that is a member selected from the group consisting of acute arthritis; acute gouty arthritis; chronic inflammatory arthritis; degenerative arthritis; infectious arthritis; Lyme arthritis; proliferative arthritis; psoriatic arthritis; and vertebral arthritis;
- 25     - gout, and fever and pain associated with inflammation;
- 30     - an eosinophil-related disorder of whatever type, etiology, or pathogenesis; or an eosinophil-related disorder that is a member selected from the group consisting of eosinophilia; pulmonary infiltration eosinophilia; Löffler's syndrome; chronic eosinophilic pneumonia; tropical pulmonary eosinophilia; bronchopneumonic aspergillosis; aspergilloma; granulomas containing eosinophils; allergic granulomatous angiitis or Churg-Strauss syndrome; polyarteritis nodosa (PAN); and systemic necrotizing vasculitis;
- 35     - atopic dermatitis; or allergic dermatitis; or allergic or atopic eczema;
- 40     - urticaria of whatever type, etiology, or pathogenesis; or urticaria that is a member selected from the group consisting of immune-mediated urticaria; complement-mediated urticaria; urticariogenic material-induced urticaria; physical agent-induced urticaria; stress-induced urticaria; idiopathic urticaria; acute urticaria; chronic urticaria; angioedema; cholinergic urticaria; cold urticaria in the autosomal dominant form or in the acquired form; contact urticaria; giant urticaria; and papular urticaria;
- 45     - conjunctivitis of whatever type, etiology, or pathogenesis; or conjunctivitis that is a member selected from the group consisting of actinic conjunctivitis; acute catarrhal conjunctivitis; acute contagious conjunctivitis; allergic conjunctivitis; atopic conjunctivitis; chronic catarrhal conjunctivitis; purulent conjunctivitis; and vernal conjunctivitis

- pulmonary hypertension; and hypoxia-induced pulmonary hypertension;
- bone loss diseases; primary osteoporosis; and secondary osteoporosis;
- central nervous system disorders of whatever type, etiology, or pathogenesis; or a central nervous system disorder that is a member selected from the group consisting of depression; Parkinson's disease; learning and memory impairment; tardive dyskinesia; drug  
5 dependence; arteriosclerotic dementia; and dementias that accompany Huntington's chorea, Wilson's disease, paralysis agitans, and thalamic atrophies;
- infection, especially infection by viruses wherein such viruses increase the production of TNF- $\alpha$  in their host, or wherein such viruses are sensitive to upregulation of TNF- $\alpha$  in their  
10 host so that their replication or other vital activities are adversely impacted, including a virus which is a member selected from the group consisting of HIV-1, HIV-2, and HIV-3; cytomegalovirus, CMV; influenza; adenoviruses; and Herpes viruses, including *Herpes zoster* and *Herpes simplex*;
- yeast and fungus infections wherein said yeast and fungi are sensitive to upregulation by  
15 TNF- $\alpha$  or elicit TNF- $\alpha$  production in their host, e.g., fungal meningitis; particularly when administered in conjunction with other drugs of choice for the treatment of systemic yeast and fungus infections, including but are not limited to, polymixins, e.g., Polymycin B; imidazoles, e.g., clotrimazole, econazole, miconazole, and ketoconazole; triazoles, e.g.,  
20 fluconazole and itraconazole; and amphotericins, e.g., Amphotericin B and liposomal Amphotericin B.
- ischemia-reperfusion injury; autoimmune diabetes; retinal autoimmunity; chronic lymphocytic leukemia; HIV infections; lupus erythematosus; kidney and ureter disease; urogenital and gastrointestinal disorders; and prostate diseases.

In particular, the compounds of Formula (1.0.0) are useful in the treatment of (1)  
25 inflammatory diseases and conditions comprising: joint inflammation, rheumatoid arthritis, rheumatoid spondylitis, osteoarthritis, inflammatory bowel disease, ulcerative colitis, chronic glomerulonephritis, dermatitis, and Crohn's disease; (2) respiratory diseases and conditions comprising: asthma, acute respiratory distress syndrome, chronic pulmonary inflammatory disease, bronchitis, chronic obstructive airway disease, and silicosis; (3) infectious diseases  
30 and conditions comprising: sepsis, septic shock, endotoxic shock, gram negative sepsis, toxic shock syndrome, fever and myalgias due to bacterial, viral or fungal infection, and influenza; (4) immune diseases and conditions comprising: autoimmune diabetes, systemic lupus erythematosus, graft vs. host reaction, allograft rejections, multiple sclerosis, psoriasis, and allergic rhinitis; and (5) other diseases and conditions comprising: bone resorption diseases;  
35 reperfusion injury; cachexia secondary to infection or malignancy; cachexia secondary to

- uveitis of whatever type, etiology, or pathogenesis; or uveitis that is a member selected from the group consisting of inflammation of all or part of the uvea; anterior uveitis; iritis; cyclitis; iridocyclitis; granulomatous uveitis; nongranulomatous uveitis; phacoantigenic uveitis; posterior uveitis; choroiditis; and chorioretinitis;
- 5    - psoriasis;
- multiple sclerosis of whatever type, etiology, or pathogenesis; or multiple sclerosis that is a member selected from the group consisting of primary progressive multiple sclerosis; and relapsing remitting multiple sclerosis;
- 10   - autoimmune/inflammatory diseases of whatever type, etiology, or pathogenesis; or an autoimmune/inflammatory disease that is a member selected from the group consisting of autoimmune hematological disorders; hemolytic anemia; aplastic anemia; pure red cell anemia; idiopathic thrombocytopenic purpura; systemic lupus erythematosus; polychondritis; scleroderma; Wegner's granulomatosis; dermatomyositis; chronic active hepatitis; myasthenia gravis; Stevens-Johnson syndrome; idiopathic sprue; autoimmune
- 15   inflammatory bowel diseases; ulcerative colitis; Crohn's disease; endocrin opthamopathy; Grave's disease; sarcoidosis; alveolitis; chronic hypersensitivity pneumonitis; primary biliary cirrhosis; juvenile diabetes or diabetes mellitus type I; anterior uveitis; granulomatous or posterior uveitis; keratoconjunctivitis sicca; epidemic keratoconjunctivitis; diffuse interstitial pulmonary fibrosis or interstitial lung fibrosis; idiopathic pulmonary fibrosis; cystic fibrosis;
- 20   psoriatic arthritis; glomerulonephritis with and without nephrotic syndrome; acute glomerulonephritis; idiopathic nephrotic syndrome; minimal change nephropathy; inflammatory/hyperproliferative skin diseases; psoriasis; atopic dermatitis; contact dermatitis; allergic contact dermatitis; benign familial pemphigus; pemphigus erythematosus; pemphigus foliaceus; and pemphigus vulgaris;
- 25   - prevention of allogeneic graft rejection following organ transplantation;
- inflammatory bowel disease (IBD) of whatever type, etiology, or pathogenesis; or inflammatory bowel disease that is a member selected from the group consisting of ulcerative colitis (UC); collagenous colitis; colitis polyposa; transmural colitis; and Crohn's disease (CD);.
- 30   - septic shock of whatever type, etiology, or pathogenesis; or septic shock that is a member selected from the group consisting of renal failure; acute renal failure; cachexia; malarial cachexia; hypophysial cachexia; uremic cachexia; cardiac cachexia; cachexia suprarenalis or Addison's disease; cancerous cachexia; and cachexia as a consequence of infection by the human immunodeficiency virus (HIV);
- 35   - liver injury;

human acquired immune deficiency syndrome (AIDS), human immunodeficiency virus (HIV) infection, or AIDS related complex (ARC); keloid formation; scar tissue formation; type 1 diabetes mellitus; and leukemia.

The present invention still further relates to the combination of a compound of  
5 Formula (1.0.0) together with one or more members selected from the group consisting of the following: (a) leukotriene biosynthesis inhibitors: 5-lipoxygenase (5-LO) inhibitors and 5-lipoxygenase activating protein (FLAP) antagonists selected from the group consisting of zileuton; ABT-761; fenleuton; tepoxalin; Abbott-79175; Abbott-85761; *N*-(5-substituted)-thiophene-2-alkylsulfonamides of Formula (5.2.8); 2,6-di-*tert*-butylphenol hydrazones of  
10 Formula (5.2.10); the class of methoxytetrahydropyrans which includes Zeneca ZD-2138 of Formula (5.2.11); the compound SB-210661 of Formula (5.2.12) and the class to which it belongs; the class of pyridinyl-substituted 2-cyanonaphthalene compounds to which L-739,010 belongs; the class of 2-cyanoquinoline compounds to which L-746,530 belongs; the classes of indole and quinoline compounds to which MK-591, MK-886, and BAY x 1005  
15 belong; (b) receptor antagonists for leukotrienes LTB<sub>4</sub>, LTC<sub>4</sub>, LTD<sub>4</sub>, and LTE<sub>4</sub> selected from the group consisting of the phenothiazin-3-one class of compounds to which L-651,392 belongs; the class of amidino compounds to which CGS-25019c belongs; the class of benzoxazolamines to which ontazolast belongs; the class of benzenecarboximidamides to which BIL 284/260 belongs; and the classes of compounds to which zafirlukast, ablukast,  
20 montelukast, pranlukast, verlukast (MK-679), RG-12525, Ro-245913, iralukast (CGP 45715A), and BAY x 7195 belong; (c) PDE4 inhibitors including inhibitors of the isoform PDE4D; (d) 5-Lipoxygenase (5-LO) inhibitors; or 5-lipoxygenase activating protein (FLAP) antagonists; (e) dual inhibitors of 5-lipoxygenase (5-LO) and antagonists of platelet activating factor (PAF); (f) leukotriene antagonists (LTRAs) including antagonists of LTB<sub>4</sub>, LTC<sub>4</sub>, LTD<sub>4</sub>,  
25 and LTE<sub>4</sub>; (g) antihistaminic H<sub>1</sub> receptor antagonists including cetirizine, loratadine, desloratadine, fexofenadine, astemizole, azelastine, and chlorpheniramine; (h) gastroprotective H<sub>2</sub> receptor antagonists; (i)  $\alpha_1$ - and  $\alpha_2$ -adrenoceptor agonist vasoconstrictor sympathomimetic agents administered orally or topically for decongestant use, including propylhexedrine, phenylephrine, phenylpropanolamine, pseudoephedrine, naphazoline  
30 hydrochloride, oxymetazoline hydrochloride, tetrahydrozoline hydrochloride, xylometazoline hydrochloride, and ethylnorepinephrine hydrochloride; (j)  $\alpha_1$ - and  $\alpha_2$ -adrenoceptor agonists in combination with inhibitors of 5-lipoxygenase (5-LO); (k) anticholinergic agents including ipratropium bromide, tiotropium bromide, oxitropium bromide, perenzepine, and telenzepine;  
(l)  $\beta_1$ - to  $\beta_4$ -adrenoceptor agonists including metaproterenol, isoproterenol, isoprenaline, albuterol, salbutamol, formoterol, salmeterol, terbutaline, orciprenaline, bitolterol mesylate,  
35 and pirbuterol; (m) methylxanthanines including theophylline and aminophylline; (n) sodium cromoglycate; (o) muscarinic receptor (M1, M2, and M3) antagonists; (p) COX-1 inhibitors

(NSAIDs); COX-2 selective inhibitors including rofecoxib; and nitric oxide NSAIDs; (q) insulin-like growth factor type I (IGF-1) mimetics; (r) ciclesonide; (s) inhaled glucocorticoids with reduced systemic side effects, including prednisone, prednisolone, flunisolide, triamcinolone acetonide, beclomethasone dipropionate, budesonide, fluticasone propionate, and mometasone furoate; (t) tryptase inhibitors; (u) platelet activating factor (PAF) antagonists; (v) 5 monoclonal antibodies active against endogenous inflammatory entities; (w) IPL 576; (x) anti-tumor necrosis factor (TNF $\alpha$ ) agents including Etanercept, Infliximab, and D2E7; (y) DMARDs including Leflunomide; (z) TCR peptides; (aa) interleukin converting enzyme (ICE) inhibitors; (bb) IMPDH inhibitors; (cc) adhesion molecule inhibitors including VLA-4 antagonists; (dd) 10 cathepsins; (ee) MAP kinase inhibitors; (ff) glucose-6 phosphate dehydrogenase inhibitors; (gg) kinin-B<sub>1</sub> - and B<sub>2</sub>-receptor antagonists; (hh) gold in the form of an aurothio group together with various hydrophilic groups; (ii) immunosuppressive agents, e.g., cyclosporine, azathioprine, and methotrexate; (jj) anti-gout agents, e.g., colchicine; (kk) xanthine oxidase inhibitors, e.g., allopurinol; (ll) uricosuric agents, e.g., probenecid, sulfinpyrazone, and 15 benzbromarone; (mm) antineoplastic agents, especially antimitotic drugs including the vinca alkaloids such as vinblastine and vincristine; (nn) growth hormone secretagogues; (oo) inhibitors of matrix metalloproteases (MMPs), i.e., the stromelysins, the collagenases, and the gelatinases, as well as aggrecanase; especially collagenase-1 (MMP-1), collagenase-2 (MMP-8), collagenase-3 (MMP-13), stromelysin-1 (MMP-3), stromelysin-2 (MMP-10), and 20 stromelysin-3 (MMP-11); (pp) transforming growth factor (TGF $\beta$ ); (qq) platelet-derived growth factor (PDGF); (rr) fibroblast growth factor, e.g., basic fibroblast growth factor (bFGF); (ss) granulocyte macrophage colony stimulating factor (GM-CSF); (tt) capsaicin cream; (uu) tachykinin NK-1, NK-1/NK-2, NK-2, and NK-3 receptor antagonists, including NKP-608C, SB-233412 (talnetant), and D-4418; (vv) elastase inhibitors including UT-77, and ZD-0892; and 25 (ww) adenosine A2a receptor agonists.

## DETAILED DESCRIPTION OF THE INVENTION

### 5.0 Compounds

The present invention is concerned with novel compounds of Formula (1.0.0):

(1.0.0)

The broadest scope of the compounds of the present invention is circumscribed above under Section 4.0 relating to the Summary of the Invention. A further description of said compounds is provided hereafter in terms of a range of different types and groups of embodiments, as well as specific embodiments which characterize and exemplify the compounds of Formula (1.0.0). Preferred and more preferred embodiments of said compounds are also set forth, but it will be understood that the recital of such preferences is in no way intended to, and does not limit the scope of the present invention with regard to said compounds.

As used herein, the expressions " $-(C_1-C_3)$  alkyl", " $-(C_1-C_4)$  alkyl", and " $-(C_1-C_6)$  alkyl", as well as equivalent variations of the same, are intended to include branched as well as straight chain conformations of these aliphatic groups. Thus, the above-quoted expressions include, in addition to the straight chain entities methyl, ethyl, *n*-propyl, *n*-butyl, *n*-pentyl, and *n*-hexyl, the branched chain entities *iso*-propyl, *iso*-butyl, *sec*-butyl, *tert*-butyl, *iso*-pentane (2-methylbutane), 2-methylpentane, 3-methylpentane, 1-ethylpropane, and 1-ethylbutane. The meanings of the above-quoted expressions are also intended to apply to said expressions whether or not they are substituted. Thus, the expression "fluorinated- $-(C_1-C_3)$  alkyl" is intended to encompass the various fluorinated species of the *n*-propyl and *iso*-propyl aliphatic groups.

As used herein with respect to compounds of Formula (1.0.0), as well as other formulas and partial formulas relating thereto, where one or more nitrogen atom components thereof is or are represented as  $N [= (O)]$ , it or they comprise(s) an optional nitrogen oxide form of said nitrogen atom(s). Where there is more than one such nitrogen oxide form, they are selected independently of each other. Further, it will be appreciated that said nitrogen oxide form(s) may also be represented as " $[N \Rightarrow (O)]_u$ " where  $u$  is 0 or 1.

Preferred embodiments of the present invention include those wherein  $m$  is 1 and  $n$  is 1;  $R^A$  and  $R^B$  are  $-H$ ,  $-CF_3$ , or  $-(C_1-C_6)$  alkyl substituted by 0 or 1 of  $-F$ ,  $-Cl$ ,  $-CF_3$ ,  $-CN$ ,  $-NH_2$ , or  $-C(=O)NH_2$ , or both taken together are spiro  $-(C_3-C_6)$  cycloalkyl- substituted by 0 or 1 of  $-F$ ,  $-Cl$ ,  $-CF_3$ , or  $-CN$ ; one of  $R^C$  and  $R^D$  is  $-H$ , and the other is  $-H$ ,  $-(C_1-C_4)$  alkyl, or phenyl, each substituted by 0 or 1 of  $-F$ ,  $-Cl$ , or  $-CN$ ;  $W$  is  $-O-$ ;  $Y$  is  $=C(R^E)-$  where  $R^E$  is  $-H$ ,  $-F$ ,  $-Cl$ ,  $-CN$ ,  $-CH_3$ , or  $-OCH_3$ ;  $R^1$  and  $R^2$  are  $-H$ ,  $-F$ ,  $-Cl$ ,  $-CN$ ,  $-NO_2$ ,  $-OH$ ,  $-CH_3$ ,  $-OCH_3$ ,  $-OCHF_2$ , or  $-OCF_3$ ;  $R^3$  is  $-H$  or  $-CH_3$ ;  $R^4$  is  $-H$ ,  $-F$ ,  $-CN$ ,  $-NO_2$ ,  $-OH$ ,  $-CH_3$ , or  $-OCH_3$ ;  $R^5$  and  $R^6$  are taken together to form a moiety of partial Formula (1.1.1), partial Formula (1.1.4), or partial Formula (1.1.5) where  $R^7$  and  $R^8$  are absent in each said partial Formula,  $-H$ , or  $-CH_3$ ;  $Q$  is phenyl, norbornanyl, furanyl, thienyl, pyrimidinyl, or cyclohexyl; and  $Z$  is  $-OR^{12}$  or  $-C(=O)R^{12}$  where  $R^{12}$  is  $-H$ ,  $-CH_3$ ,  $-CH_2CH_3$ , or  $-C(CH_3)_3$ ; or  $Z$  is  $-CN$ .

Of these preferred embodiments, there is particularly included those wherein  $R^A$  and  $R^B$  are both  $-\text{CH}_3$ , or one is  $-\text{CH}_3$  and the other is  $-\text{CH}(\text{CH}_3)_2$  or  $-\text{C}(\text{CH}_3)_3$ , or one is  $-\text{H}$  and the other is  $-\text{CH}_3$  or  $-\text{CF}_3$ , or both taken together are spiro cyclopropyl or spiro cyclobutyl; one of  $R^C$  and  $R^D$  is  $-\text{H}$  and the other is  $-\text{H}$  or  $-\text{CH}_3$ ;  $Y$  is  $=\text{C}(\text{R}^E)-$  where  $\text{R}^E$  is  $-\text{H}$ ,  $-\text{F}$ , or  $-\text{Cl}$ ;  $R^1$  and  $R^2$  are  $-\text{H}$ ,  $-\text{F}$ , or  $\text{Cl}$ ;  $R^3$  is  $-\text{H}$ ;  $R^4$  is  $-\text{H}$ ;  $R^5$  and  $R^6$  are taken together to form a moiety of partial Formula (1.1.1) or partial Formula (1.1.4) where  $R^7$  and  $R^8$  are both absent;  $Q$  is phenyl, thienyl, or cyclohexyl; and  $Z$  is  $-\text{OR}^{12}$  where  $\text{R}^{12}$  is  $-\text{H}$ , or  $Z$  is  $-\text{C}(=\text{O})\text{R}^{12}$  where  $\text{R}^{12}$  is  $-\text{H}$  or  $-\text{CH}_3$ , or  $Z$  is  $-\text{CN}$ .

Of these preferred embodiments, there is further particularly included those wherein  $R^A$  and  $R^B$  are both  $-\text{CH}_3$ , or both taken together are spiro cyclopropyl; one of  $R^C$  and  $R^D$  is  $-\text{H}$  and the other is  $-\text{H}$  or  $-\text{CH}_3$ ;  $Y$  is  $=\text{C}(\text{R}^E)-$  where  $\text{R}^E$  is  $-\text{H}$ ,  $-\text{F}$ , or  $-\text{Cl}$ ;  $R^1$  and  $R^2$  are  $-\text{H}$ ,  $-\text{F}$ , or  $\text{Cl}$ ;  $R^3$  is  $-\text{H}$ ;  $R^4$  is  $-\text{H}$ ;  $R^5$  and  $R^6$  are taken together to form a moiety of partial Formula (1.1.1) where  $R^7$  and  $R^8$  are both absent; and  $Z$  is  $-\text{OR}^{12}$  where  $\text{R}^{12}$  is  $-\text{H}$ .

Further preferred embodiments of the type just recited comprise those wherein  $R^A$  and  $R^B$  are both  $-\text{CH}_3$ ;  $R^C$  and  $R^D$  are both  $-\text{H}$ ;  $Y$  is  $=\text{C}(\text{R}^E)-$  where  $\text{R}^E$  is  $-\text{H}$ ; and one of  $R^1$  and  $R^2$  is  $-\text{H}$  and the other is  $-\text{F}$ .

Still further preferred embodiments of the type just recited are those wherein  $Y$  is  $=\text{C}(\text{R}^E)-$  where  $\text{R}^E$  is  $-\text{F}$ ; and  $R^1$  and  $R^2$  are both  $-\text{H}$ .

Of the preferred embodiments of the compounds of Formula (1.0.0), there is particularly included those wherein  $R^5$  and  $R^6$  are taken together to form a moiety of partial Formula (1.1.4), and further wherein  $R^A$  and  $R^B$  are both  $-\text{CH}_3$ , or one is  $-\text{H}$  and the other is  $-\text{CH}_3$ , or both together are spiro cyclopropyl; one of  $R^C$  and  $R^D$  is  $-\text{H}$  and the other is  $-\text{H}$  or  $-\text{CH}_3$ ;  $Y$  is  $=\text{C}(\text{R}^E)-$  where  $\text{R}^E$  is  $-\text{H}$  or  $-\text{F}$ ;  $R^1$  and  $R^2$  are  $-\text{H}$ ,  $-\text{F}$ , or  $\text{Cl}$ ;  $R^3$  is  $-\text{H}$ ;  $R^4$  is  $-\text{H}$ ;  $R^7$  and  $R^8$  are both absent;  $Q$  is phenyl, norbornanyl, furanyl, thienyl, pyrimidinyl, or cyclohexyl; and  $Z$  is  $-\text{OR}^{12}$  where  $\text{R}^{12}$  is  $-\text{H}$ .

Especially preferred embodiments of the type just recited are those wherein  $R^A$  and  $R^B$  are both  $-\text{CH}_3$ ; one of  $R^C$  and  $R^D$  is  $-\text{H}$  and the other is  $-\text{CH}_3$ ;  $Y$  is  $=\text{C}(\text{R}^E)-$  where  $\text{R}^E$  is  $-\text{H}$ ;  $R^1$  and  $R^2$  are both  $-\text{H}$ ;  $R^3$  is  $-\text{H}$ ;  $R^4$  is  $-\text{H}$ ;  $Q$  is phenyl, thienyl, or cyclohexyl; and  $Z$  is  $-\text{OR}^{12}$  where  $\text{R}^{12}$  is  $-\text{H}$ .

A further class of preferred embodiments of the compounds of Formula (1.0.0) are those wherein  $m$  is 1 and  $n$  is 1;  $R^A$  and  $R^B$  are  $-\text{H}$ ,  $-\text{CF}_3$ , or  $-(\text{C}_1-\text{C}_6)$  alkyl substituted by 0 or 1 of  $-\text{F}$ ,  $-\text{Cl}$ ,  $-\text{CF}_3$ ,  $-\text{CN}$ ,  $-\text{NH}_2$ , or  $-\text{C}(=\text{O})\text{NH}_2$ , or both taken together are spiro  $-(\text{C}_3-\text{C}_6)$  cycloalkyl- substituted by 0 or 1 of  $-\text{F}$ ,  $-\text{Cl}$ ,  $-\text{CF}_3$ , or  $-\text{CN}$ ; one of  $R^C$  and  $R^D$  is  $-\text{H}$ ,

and the other is -H, -(C<sub>1</sub>-C<sub>4</sub>) alkyl, or phenyl, each substituted by 0 or 1 of -F, -Cl, or -CN; W is -O-; Y is =C(R<sup>E</sup>)- where R<sup>E</sup> is -H, -F, -Cl, -CN, -CH<sub>3</sub>, or -OCH<sub>3</sub>; R<sup>1</sup> and R<sup>2</sup> are -H, -F, -Cl, -CN, -NO<sub>2</sub>, -OH, -CH<sub>3</sub>, -OCH<sub>3</sub>, -OCHF<sub>2</sub>, or -OCF<sub>3</sub>; R<sup>3</sup> is -H; R<sup>4</sup> is -H, -F, -CN, -NO<sub>2</sub>, -OH, -CH<sub>3</sub>, or -OCH<sub>3</sub>; R<sup>5</sup> and R<sup>6</sup> are taken together to form a moiety of partial Formula (1.1.5) where R<sup>7</sup> is -H or -CH<sub>3</sub>; Q is phenyl, norbornanyl, furanyl, thienyl, pyrimidinyl, or cyclohexyl; and Z is -OR<sup>12</sup>, where R<sup>12</sup> is -H, -CH<sub>3</sub>, -CH<sub>2</sub>CH<sub>3</sub>, or -C(CH<sub>3</sub>)<sub>3</sub>; or Z is -CN.

Of these preferred embodiments, there is particularly included those wherein R<sup>A</sup> and R<sup>B</sup> are both -CH<sub>3</sub>, or one is -CH<sub>3</sub> and the other is -CH(CH<sub>3</sub>)<sub>2</sub> or -C(CH<sub>3</sub>)<sub>3</sub>, or one is -H and the other is -CH<sub>3</sub> or -CF<sub>3</sub>, or both taken together are spiro cyclopropyl or spiro cyclobutyl; one of R<sup>C</sup> and R<sup>D</sup> is -H and the other is -H or -CH<sub>3</sub>; Y is =C(R<sup>E</sup>)- where R<sup>E</sup> is -H, -F, or -Cl; R<sup>1</sup> and R<sup>2</sup> are -H, -F, or Cl; R<sup>3</sup> is -H; R<sup>4</sup> is -H; Q is phenyl, thienyl, or cyclohexyl; and Z is -OR<sup>12</sup> where R<sup>12</sup> is -H, or Z is -C(=O)R<sup>12</sup> where R<sup>12</sup> is -H or -CH<sub>3</sub>, or Z is -CN.

The core nucleus of the compounds of Formula (1.0.0) is that of nicotinamide of partial Formula (1.0.1):

(1.0.1)

derived from nicotinic acid. This core nucleus is then elaborated by defining the Y moiety as being =C(R<sup>E</sup>)-; or -[N≡(O)]-. Where Y has the meaning of -[N≡(O)]- the compounds of the present invention are pyrimidines. The pyrimidine group of compounds of Formula (1.0.0) is a significant part of the scope of the present invention. It is preferred, nevertheless, that the compounds of Formula (1.0.0) have the Y moiety defined as =C(R<sup>E</sup>)- where the substituent R<sup>E</sup> in addition to -H, is defined as a member selected from the group consisting of -F; -Cl; -CN; -NO<sub>2</sub>; (C<sub>1</sub>-C<sub>3</sub>)alkyl; fluorinated-(C<sub>1</sub>-C<sub>3</sub>) alkyl; (C<sub>1</sub>-C<sub>3</sub>)alkoxy; fluorinated-(C<sub>1</sub>-C<sub>3</sub>) alkoxy; -OH; and -C(=O)NH<sub>2</sub>. It is preferred that the R<sup>E</sup> substituent have the meaning of -F; -Cl; -CH<sub>3</sub>; or -OCH<sub>3</sub>; and more preferably R<sup>E</sup> is -F; or -H, i.e., in those embodiments where R<sup>E</sup> is -H there is no substituent at the 5-position of the nicotinamide group occupied by the moiety Y.

In certain embodiments of the compounds of Formula (1.0.0) where Y is =C(R<sup>E</sup>)- and the moiety Q is phenyl, the substituents at the 5-position of the nicotinamide core

nucleus and at the 2'-position of the phenyl group attached to the amide portion thereof, are selected from the same group of definitions, although on an independent basis. The substituents involved may be illustrated by Formula (1.0.2) as follows:

(1.0.2)

The 5-position and 2'-position substituents,  $R^E$  and  $R^1$ , respectively, serve the same function of modulating the properties of the overall compound of Formula (1.0.0) with respect to its pharmacological and pharmacokinetic properties such as potency, and substrate specificity (selectivity), as well as physico-chemical properties. In preferred embodiments of the compounds of the present invention of this type, the  $R^E$  and  $R^1$  substituents have the following meanings: -H and -H; -H and -F; -F and -H; and -F and -F; respectively.

### 5.1 Linkage (W) and $R^4$ Substituted - $R^5$ / $R^6$ Benzo-Fused Bicyclic Heterocycles

The nicotinamide core nucleus is further elaborated by allowing the 2-position carbon atom in the pyridyl or pyrimidinyl ring of the nucleus of Formula (1.0.1) to form an ether, thioether, or amine linkage to a phenyl ring that is substituted by a moiety  $R^4$ . The substituent  $R^4$  may be attached to any available carbon atom and has the same meaning as defined above. More significantly, this phenyl ring together with its  $R^5$  and  $R^6$  substituents, forms a benzo-fused, bicyclic heterocycle. This results directly from the definition of  $R^5$  and  $R^6$  as taken together to form a moiety which is a member selected from the group consisting of partial Formulas (1.1.1) through (1.1.5):

Accordingly, there further results moieties of partial Formulas (1.0.3), (1.0.4), (1.0.5), (1.0.6), and (1.0.7):

(1.0.3)

(1.0.4)

(1.0.5)

(1.0.6)

(1.0.7)

where W has the meaning of  $-O-$ ;  $-S(=O)_t-$  where t is 0, 1, or 2; or  $-N(R^3)-$ . In preferred compounds of Formula (1.0.1), and thus in turn of (1.0.0), W has the meaning of  $-O-$  whereby an ether linkage is created to attach the benzo-fused, bicyclic heterocycle to the

10

In other preferred embodiments of the compounds of Formula (1.0.0),  $R^7$  and  $R^8$  are both absent. It will be recognized that where  $R^7$  and  $R^8$  are both absent, and the dashed lines:  $- - -$  therefore represent double bonds, that the phenyl portion of the resulting benzo-fused bicyclic heterocycles depicted in partial Formulas (1.0.3), (1.0.5), (1.0.6), and (1.0.7) cannot have all of the double bonds depicted in said partial Formulas, since the result would be prohibited pentavalent carbon atoms in said phenyl portion.

15

Accordingly, where  $R^7$  and  $R^8$  are both absent, the resulting compounds are characterized by such structures as those shown in partial Formulas (1.0.8) and (1.0.9):

(1.0.8)

(1.0.9)

In other preferred embodiments of the compounds of Formula (1.0.0), the benzo-fused, bicyclic heterocycle has the meaning of a moiety of partial Formula (1.0.3). Where this  
 5 and other preferred aspects of the compounds of Formula (1.0.0) are selected at the same time, the result is a moiety of partial Formula (1.0.10):

(1.0.10)

In other embodiments of the present invention, W has the meaning of —S—, or it  
 10 may have the meaning of —N(R<sup>3</sup>)— where R<sup>3</sup> is preferably —H. There is thereby formed either a thioether linkage or an amine linkage. Where the sulfur linkage is selected, and R<sup>7</sup> and R<sup>8</sup> are both absent, there results still further embodiments of the compounds of the present invention which may be represented by partial Formula (1.0.11):

(1.0.11)

Accordingly, concerning the substituents  $R^7$  and  $R^8$  on the benzo-fused, bicyclic heterocycles represented by the moieties of partial Formulas (1.1.1), (1.1.2), (1.1.3), (1.1.4), and (1.1.5); and those of partial Formulas (1.0.3), (1.0.4), (1.0.5), (1.0.6), and (1.0.7),  $R^7$  and  $R^8$ , in each said partial Formula, are each independently  $-H$ ;  $-CH_3$ ;  $-OCH_3$ ; or absent, in which case the dashed line  $- - -$  represents a double bond, provided that there are no pentavalent carbon atoms in the phenyl portion of said benzo-fused, bicyclic heterocycles.

The medicinal chemist will appreciate that the choice of substituents from those described above will be influenced by the effect which such substituents have in turn on the lipophilicity and physico-chemical properties of the overall molecules which result. The present state of the art provides the capability of quickly and facilely synthesizing a very large number of chemically very similar compounds based on the substituent choices outlined above, and of thereafter testing the relative effectiveness of the resulting molecules in rapid *in vitro* testing methods. Combinatorial chemistry synthesis and testing procedures currently available in the art have even more considerably expanded the number of substituent combinations which can be rapidly evaluated. The information which has thereby been produced through use of these techniques permits a reasonable prediction herein of certain preferences which exist as to various embodiments of the present invention. Such preferred embodiments are described in detail herein.

Where  $R^5$  and  $R^6$  are taken together to form the moieties of partial Formulas (1.1.1), (1.1.2), (1.1.3), (1.1.4), and (1.1.5), and  $R^7$  and  $R^8$  are as defined, benzofurazans and analogous groups and substituted derivatives thereof are formed, including, *inter alia*, the following moieties of partial Formulas (2.1.1) through (2.1.23):

(2.1.1)

(2.1.2)

(2.1.3)

(2.1.4)

(2.1.5)

(2.1.6)

(2.1.7)

(2.1.8)

(2.1.9)

(2.1.10)

(2.1.11)

(2.1.12)

(2.1.13)

(2.1.14)

(2.1.15)

(2.1.16)

(2.1.17)

(2.1.18)

(2.1.19)

(2.1.20)

(2.1.21)

(2.1.22)

(2.1.23)

wherein the dashed line - - - - in partial Formulas (2.1.3), (2.1.4), (2.1.5), (2.1.7), (2.1.21) and (2.1.22) represents a double bond where no oxygen atom is attached to the corresponding nitrogen atom, and represents a single bond where an oxygen atom is attached to said corresponding nitrogen atom.

- 5 The artisan of ordinary skill in the preparation of organic molecules will appreciate that the compounds of Formula (1.0.0) wherein  $R^5$  and  $R^6$  are taken together to form moieties of the above-illustrated partial Formulas (2.1.2), (2.1.10), (2.1.11), (2.1.13), (2.1.15), (2.1.17), and (2.1.23) exist in tautomeric form, and each moiety of said partial Formulas has a tautomer counterpart. These tautomers are related by the shift of a hydrogen and one or more  $\pi$ -
- 10 bonds. Whenever necessary, the skilled artisan will be able to readily discern or determine which tautomeric form is present or is the most stable.

Consequently, a carbonyl tautomer of a compound of Formula (1.0.0) will, in general terms, be considerably more stable than its iminol counterpart. Wherever a compound of Formula (1.0.0) is described or depicted as having a carbonyl moiety with an  $\alpha$ -hydrogen,

15 both the carbonyl and the iminol tautomers thereof are included within the scope of the present invention.

## 5.2 The $R^C/R^D$ Moiety

The moiety  $-[R^A-C-R^B]_m-$ , which appears near the right-hand terminus of Formula (1.0.0), is described further below, after the description of the moiety Q. This placement is consistent with the detailed description of the components of Formula (1.0.0) thus far, which has proceeded from left to right. The moieties  $-[R^C-C-R^D]_n-$  and  $-[R^A-C-R^B]_m-$  have been described herein in a similar manner, but this is in no way intended to limit the independent choice of meanings for these two moieties. The description of the moiety  $-[R^C-C-R^D]_n-$  is set out in the paragraphs immediately below.

The ether, thioether, or amine linked nicotinamide entity which characterizes the left-hand side of the molecule of the compounds of Formula (1.0.0) described above, is connected to the moiety Q, which is substituted by  $R^1$  and  $R^2$ , by way of the linking group which may be represented by partial Formula (1.1.9):

(1.1.9)

where  $n$  is 1 or 2. In the more preferred embodiments of the compounds of the present invention,  $n$  is defined as the integer 1. When  $n$  is 1 the moiety  $-[R^C-C-R^D]-$  is present, where  $R^C$  and  $R^D$  are each a member independently selected from the group consisting of -H; -F;  $-\text{CF}_3$ ;  $-(\text{C}_1\text{-C}_6)$  alkyl;  $-(\text{C}_3\text{-C}_7)$  cycloalkyl; phenyl; benzyl; and a heterocyclic moiety selected from the group consisting of pyrrolyl; pyrazolyl; imidazolyl; pyridinyl; pyrazinyl; pyrimidinyl; pyridazinyl; oxazolyl; oxazolidinyl; *iso*-oxazolyl; thiazolyl; thiazolidinyl; *iso*-thiazolyl; triazolyl; tetrazolyl; oxadiazolyl; and thiadiazolyl; wherein said alkyl, cycloalkyl, phenyl, benzyl, or heterocyclic moieties are each independently substituted with 0 to 23 substituents  $R^{10}$ . There is a proviso that at least one of  $R^C$  or  $R^D$  must be hydrogen. Preferred embodiments of the compounds of Formula (1.0.0) often consist of those where  $R^C$  and  $R^D$  are both hydrogen.

The moiety  $R^{10}$  is an optional substituent for the alkyl and heterocyclic moieties defining  $R^C$  and  $R^D$ , and has the meaning of a member selected from the group consisting of phenyl or benzyl substituted by 0, 1, or 2 of -F,  $-\text{CH}_3$ ,  $-\text{OCH}_3$ ,  $-\text{CF}_3$ , OH, -CN, or  $-\text{NH}_2$ ; and said  $R^{10}$  group further consists of -F; -Cl;  $-\text{CF}_3$ ; -CN;  $(\text{C}_1\text{-C}_2)$  alkyl;  $-\text{C}(=\text{O})\text{OR}^{12}$ ;  $-\text{O}-\text{C}(=\text{O})\text{R}^{13}$ ;  $-\text{C}(=\text{O})\text{NR}^{12}\text{R}^{13}$ ;  $-\text{O}-\text{C}(=\text{O})\text{NR}^{12}\text{R}^{13}$ ;  $-\text{NR}^{12}\text{R}^{13}$ ;  $-\text{NR}^{12}\text{C}(=\text{O})\text{R}^{13}$ ;  $-\text{NR}^{12}\text{C}(=\text{O})\text{OR}^{13}$ ; and  $-\text{NR}^{12}\text{S}(=\text{O})\text{R}^{13}$  and  $-\text{S}(=\text{O})\text{NR}^{12}\text{R}^{13}$  where  $t$  is 0, 1, or 2. The sub-substituents  $R^{12}$  and  $R^{13}$ , in turn, have the meaning of a member independently selected from the group consisting

of -H;  $-(C_1-C_4)$  alkyl; and  $-(C_3-C_6)$  cycloalkyl; wherein said alkyl and cycloalkyl are substituted by 0 to 3 substituents selected from the group consisting of -F and -Cl.

In some preferred embodiments of the present invention,  $R^C$  and  $R^D$  both have the meaning of -H, so that a methylene bridging element results which separates the moiety Q substituted by  $R^1$  and  $R^2$  from the remainder of the left-hand side of the compounds of Formula (1.0.0). In other preferred embodiments, either  $R^C$  or  $R^D$  is -H as required while the other is methyl, ethyl, *iso*-propyl, *tert*-butyl, cyclopropyl, cyclobutyl, cyclopentyl, cyclohexyl, phenyl, benzyl, pyrrolyl, imidazolyl, pyridinyl, oxazolyl, thiazolyl, or oxadiazolyl, each of which is optionally substituted by a single substituent  $R^{10}$ .

Thus, in accordance with the above description, representative embodiments of the linking group of partial Formula (1.1.9):

(1.1.9)

include, but are not limited to, the moieties of partial Formulas (2.2.1) through (2.2.41):

A linking group that ties together the moiety Q substituted by R<sup>1</sup> and R<sup>2</sup>, and the moiety Z in the compounds of the present invention may be represented by partial Formula (1.1.10):

5

(1.1.10)

where R<sup>A</sup>, R<sup>B</sup>, and m have the same meaning as defined above. It will be understood, however, that selection of the particular meaning of R<sup>C</sup> or R<sup>D</sup> will not necessarily be a factor, or at least will not be a predetermining factor, in the selection of the meaning of R<sup>A</sup> or R<sup>B</sup>. The selection of the subscript m will also be made independent of the selection of the subscript n.

### 10 5.3 The R<sup>A</sup> / R<sup>B</sup> Moiety

A linking group that ties together the moiety Q substituted by R<sup>1</sup> and R<sup>2</sup>, and the moiety Z in the compounds of the present invention may be represented by partial Formula (1.1.10):

(1.1.10)

where  $\text{R}^{\text{A}}$ ,  $\text{R}^{\text{B}}$ , and  $m$  have the meanings described further below. As already indicated, selection of some particular meaning of  $\text{R}^{\text{C}}$  or  $\text{R}^{\text{D}}$  as discussed above, will not necessarily be a factor, i.e., will not be a predetermining factor, in the selection of the meaning of  $\text{R}^{\text{A}}$  or  $\text{R}^{\text{B}}$ . The selection of the numerical value for the subscript  $m$  is also to be made independently of the selection of the numerical value for the subscript  $n$ .

For the moiety  $[\text{R}^{\text{A}}-\text{C}-\text{R}^{\text{B}}]_m$ , the subscript  $m$  is 0, 1, or 2. In most of the preferred embodiments of the present invention the meaning of  $m$  is 1.

Both  $\text{R}^{\text{A}}$  and  $\text{R}^{\text{B}}$  may have the meaning of  $-\text{H}$ , thereby resulting in a methylene bridging moiety where  $m$  is 1. In most of the preferred compounds of Formula (1.0.0),  $m$  is 1 and  $\text{R}^{\text{A}}$  and  $\text{R}^{\text{B}}$  are both methyl. Where  $m$  is 1, it is also preferred that one of  $\text{R}^{\text{A}}$  and  $\text{R}^{\text{B}}$  be  $-\text{H}$  and that the other be  $-\text{CH}_3$ . In other embodiments, one of  $\text{R}^{\text{A}}$  and  $\text{R}^{\text{B}}$  is  $-\text{H}$  while the other of  $\text{R}^{\text{A}}$  and  $\text{R}^{\text{B}}$  is selected from their other meanings, which include  $-(\text{C}_1-\text{C}_6)$  alkyl and  $-(\text{C}_3-\text{C}_7)$  cycloalkyl. As with other substituent definitions herein that include an alkyl moiety, it may be a straight or branched chain aliphatic group. Where the  $-(\text{C}_1-\text{C}_4)$  alkyl moiety is branched; accordingly, *iso*-propyl, *sec*-butyl, and *tert*-butyl are meanings of  $\text{R}^{\text{A}}$  and  $\text{R}^{\text{B}}$ . Where  $m$  is 1,  $-\text{H}$  or methyl is the preferred meaning for both  $\text{R}^{\text{A}}$  and  $\text{R}^{\text{B}}$ , and both  $\text{R}^{\text{A}}$  and  $\text{R}^{\text{B}}$  may be  $-\text{H}$  or methyl at the same time. It is especially preferred that  $\text{R}^{\text{A}}$  and  $\text{R}^{\text{B}}$  both have the meaning of  $-\text{CH}_3$ .

Where  $\text{R}^{\text{A}}$  and  $\text{R}^{\text{B}}$  have the meaning of  $-(\text{C}_1-\text{C}_6)$  alkyl or  $-(\text{C}_3-\text{C}_7)$  cycloalkyl, said alkyl or cycloalkyl moiety may be substituted by 0 to 3 substituents  $\text{R}^{10}$ , where  $\text{R}^{10}$  is  $-\text{F}$ ;  $-\text{Cl}$ ;  $-\text{CF}_3$ ;  $-\text{CN}$ ;  $(\text{C}_1-\text{C}_2)$  alkyl;  $-\text{OR}^{12}$ ;  $-\text{C}(=\text{O})\text{OR}^{12}$ ;  $-\text{O}-\text{C}(=\text{O})\text{R}^{13}$ ;  $-\text{C}(=\text{O})\text{NR}^{12}\text{R}^{13}$ ;  $-\text{O}-\text{C}(=\text{O})\text{NR}^{12}\text{R}^{13}$ ;  $-\text{NR}^{12}\text{R}^{13}$ ;  $-\text{NR}^{12}\text{C}(=\text{O})\text{R}^{13}$ ;  $-\text{NR}^{12}\text{C}(=\text{O})\text{OR}^{13}$ ;  $-\text{NR}^{12}\text{S}(=\text{O})_2\text{R}^{13}$ ; or  $-\text{S}(=\text{O})_2\text{NR}^{12}\text{R}^{13}$ .

Where  $\text{R}^{\text{A}}$  and/or  $\text{R}^{\text{B}}$  is substituted by  $\text{R}^{10}$  and the meaning of  $\text{R}^{10}$  is defined as  $-\text{OR}^{12}$ ,  $-\text{O}-\text{C}(=\text{O})\text{R}^{13}$ , or  $-\text{OC}(=\text{O})\text{NR}^{12}\text{R}^{13}$  the resulting substituent is subject to the proviso that for this and all other applicable meanings of  $\text{R}^{\text{A}}$  and  $\text{R}^{\text{B}}$ , the positional relationship of said  $-\text{OR}^{12}$ ,  $-\text{O}-\text{C}(=\text{O})\text{R}^{13}$ , or  $-\text{OC}(=\text{O})\text{NR}^{12}\text{R}^{13}$  to the  $-\text{OR}^{12}$  radical that is a meaning of  $\text{Z}$ , is other than a vicinal one. In other words, where  $\text{Z}$  has the meaning of  $-\text{OR}^{12}$ , and with regard to the moiety  $[\text{R}^{\text{A}}-\text{C}-\text{R}^{\text{B}}]_m$ ,  $m$  is 1 and  $\text{R}^{\text{A}}$  and/or  $\text{R}^{\text{B}}$  is substituted by  $-\text{OR}^{12}$ ,  $-\text{O}-\text{C}(=\text{O})\text{R}^{13}$ , or  $-\text{OC}(=\text{O})\text{NR}^{12}\text{R}^{13}$ , the resulting  $\text{Z}$  and  $\text{R}^{10}$  substituents: (1)  $-\text{OR}^{12}$  and (2)  $-\text{OR}^{12}$ ,  $-\text{O}-\text{C}(=\text{O})\text{R}^{13}$ .

or  $-\text{OC}(=\text{O})\text{NR}^{12}\text{R}^{13}$ , respectively, may not be attached to adjacent carbon atoms, *i.e.*, be vicinal.

This proviso applies to all of the applicable meanings of  $\text{R}^{\text{A}}$  and  $\text{R}^{\text{B}}$ , whether being defined as  $-(\text{C}_1\text{-C}_6)$  alkyl or  $-(\text{C}_3\text{-C}_7)$  cycloalkyl in the instance being discussed here, or being defined as or as being taken together to form a spiro moiety of Formula (1.1.0), in the instances discussed below. It will be understood that the meanings of  $\text{R}^{\text{A}}$  and  $\text{R}^{\text{B}}$  that are phenyl, benzyl, or a heterocyclic moiety, are not applicable meanings that fall under the above-described proviso.

$\text{R}^{12}$  and  $\text{R}^{13}$ , in turn, are each selected from  $-\text{H}$ ;  $-(\text{C}_1\text{-C}_4)$  alkyl;  $(\text{C}_2\text{-C}_4)$  alkenyl;  $(\text{C}_3\text{-C}_6)$  cycloalkyl; phenyl; benzyl; and a monocyclic heterocyclic moiety comprising  $(\text{C}_3\text{-C}_6)$  cycloalkyl wherein a nitrogen heteroatom replaces one carbon atom, and optionally a second nitrogen heteroatom replaces a second carbon atom of a 5- or 6-membered said heterocyclic moiety, and further optionally wherein an oxygen heteroatom replaces a third carbon atom of a 5- or 6-membered said heterocyclic moiety; wherein said alkyl, alkenyl, cycloalkyl, phenyl, benzyl, or monocyclic heterocyclic moiety is substituted by 0 to 3 substituents selected from the group consisting of F and Cl.

In those preferred embodiments that have an  $\text{R}^{10}$  substituent on the  $-(\text{C}_1\text{-C}_4)$  alkyl  $-(\text{C}_3\text{-C}_7)$  cycloalkyl moiety defining  $\text{R}^{\text{A}}$  and  $\text{R}^{\text{B}}$ , it is preferred that this substituent be single and that this single substituent be  $-\text{F}$ ;  $-\text{Cl}$ ; or  $-\text{CF}_3$ .

The most preferred embodiments of the compounds of Formula (1.0.0) are those wherein both of  $\text{R}^{\text{A}}$  and  $\text{R}^{\text{B}}$  have the meaning of  $-\text{CH}_3$ , and wherein both of  $\text{R}^{\text{C}}$  and  $\text{R}^{\text{D}}$  have the meaning of  $-\text{H}$ .

$\text{R}^{\text{A}}$  and  $\text{R}^{\text{B}}$  also have the meaning of a heterocyclic moiety selected from the group consisting of pyrrolyl; pyrazolyl; imidazolyl; pyridinyl; pyrazinyl; pyrimidinyl; pyridazinyl; oxazolyl; oxazolidinyl; *iso*-oxazolyl; thiazolyl; thiazolidinyl; *iso*-thiazolyl; triazolyl; tetrazolyl; oxadiazolyl; and thiadiazolyl; wherein said heterocyclic moiety is substituted with 0 to 3 substituents  $\text{R}^{10}$ . Accordingly,  $\text{R}^{\text{A}}$  and  $\text{R}^{\text{B}}$  may have, *e.g.*, the meaning of 3-[O-C(=O)NH<sub>2</sub>]-pyridin-4-yl.

$\text{R}^{\text{A}}$  and  $\text{R}^{\text{B}}$  have the further meaning of being taken together to form a spiro moiety of Formula (1.1.0):

(1.1.0)

This meaning of  $\text{R}^{\text{A}}$  and  $\text{R}^{\text{B}}$  requires, of course, that  $m$  be 1 in Formula (1.0.0). For the moiety of partial Formula (1.1.0),  $r$  and  $s$  may be 0 to 4 provided that the sum of  $r + s$  is at

least 1 but not greater than 5. In preferred embodiments of the present invention, one of  $r$  and  $s$  is 0 while the other is 1, or both of  $r$  and  $s$  are 1, or one of  $r$  and  $s$  is 1 while the other is 2. The moiety  $Q^A$  is selected from  $-\text{CH}_2-$ ,  $-\text{CHF}-$ ,  $-\text{CF}_2-$ ,  $-\text{NR}^{12}-$ ,  $-\text{O}-$ ; and  $-\text{S}(=\text{O})_t-$ , where  $t$  is 0, 1, or 2; however, it is preferred that  $Q^A$  be  $-\text{CH}_2-$ .

5 Taken together with the preferred meanings of  $r$  and  $s$ , it will be seen that there results a spiro cycloalkyl group that is cyclopropyl, cyclobutyl, cyclopentyl, or cyclohexyl. Said spiro group is preferably substituted by 0 or 1 substituent  $R^{10}$  where  $R^{10}$  is  $-\text{F}$  or  $-\text{CH}_3$ . As already indicated, where  $Z$  has the meaning of  $-\text{OR}^{12}$ , and  $R^A$  and/or  $R^B$  is substituted by  $-\text{OR}^{12}$ ,  $-\text{O}-\text{C}(=\text{O})\text{R}^{13}$ , or  $-\text{OC}(=\text{O})\text{NR}^{12}\text{R}^{13}$ , the resulting  $Z$  and  $R^{10}$  substituents: (1)  $-\text{OR}^{12}$   
 10 and (2)  $-\text{OR}^{12}$ ,  $-\text{O}-\text{C}(=\text{O})\text{R}^{13}$ , or  $-\text{OC}(=\text{O})\text{NR}^{12}\text{R}^{13}$ , respectively, may not be attached to adjacent carbon atoms, *i.e.*, be vicinal. This proviso applies to all of the applicable meanings of  $R^A$  and  $R^B$ , including the instance being discussed here, *i.e.*, a spiro moiety of Formula (1.1.0).

15 Further above, a number of preferred specific meanings of  $R^C$  and  $R^D$  have been described and depicted, and these meanings are intended to comprise preferred embodiments of the present invention with respect to  $R^A$  and  $R^B$  as well. Accordingly, these meanings are not repeated here but are incorporated herein by reference, as though reiterated here *in toto*. Preferred meanings of the moieties  $R^A$  and  $R^B$  are depicted in the following partial Formulas (2.6.1) through (2.6.22):

#### 5.4 The Moiety Q

The moiety Q comprises phenyl; pyrrolyl; furanyl; thienyl; pyridyl; pyrimidinyl; imidazolyl; thiazolyl; oxazolyl; a monocyclic  $-(C_5-C_7)$  cycloalkyl moiety; a monocyclic  $-(C_5-C_7)$  cycloalkenyl moiety that is a member selected from the group consisting of cyclopentenyl, cyclohexenyl, and cycloheptenyl; or a bicyclic  $-(C_7-C_{10})$  cycloalkyl or  $-(C_7-C_{10})$  cycloalkenyl moiety, preferably one that is a member selected from the group consisting of norbornanyl, norbornenyl, bicyclo[2.2.2]octanyl, bicyclo[3.2.1]octanyl, bicyclo[3.3.0]octanyl, bicyclo[2.2.2]oct-5-enyl, bicyclo[2.2.2]oct-7-enyl, bicyclo[3.3.1]nonanyl, cyclodecanyl, and adamantanyl. All of these meanings of Q are substituted by  $R^1$  and  $R^2$  as described in detail further below. The preferred meanings of Q are phenyl, norbornanyl, thienyl, and cyclohexenyl, but other important embodiments of the compounds of Formula (1.0.0) include those where Q has the meaning of pyrrolyl; furanyl; pyridyl; pyrimidinyl; imidazolyl; and cyclohexenyl.

It will be understood that the Q moiety is a bivalent group and that the points of its attachment to the linking  $R^A / R^B$  and  $R^C / R^D$  moieties may vary with respect to each other. Thus, e.g., where Q is phenyl, said points of attachment may be in an *ortho*-, *meta*-, or *para*-relationship to each other, although the *para*-relationship is preferred.

In addition to cyclohexyl, the Q moiety may be cyclopentyl or cycloheptyl. Where the Q moiety is monocyclic  $-(C_5-C_7)$  cycloalkenyl, it has the meaning of a member selected from the group consisting of cyclopentene; cyclohexene; and cycloheptene. Where the Q moiety is bicyclic  $-(C_7-C_{10})$  cycloalkyl or  $-(C_7-C_{10})$  cycloalkenyl, preferred embodiments comprise the meaning of Q as norbornanyl, norbornenyl, bicyclo[2.2.2]octanyl, bicyclo[3.2.1]octanyl, bicyclo[3.3.0]octanyl, bicyclo[2.2.2]oct-5-enyl, bicyclo[2.2.2]oct-7-enyl, bicyclo[3.3.1]nonanyl, and adamantanyl. The above-described preferred meanings of Q may be represented by partial Formulas (1.1.11) through (1.1.21):

(1.1.11)

(1.1.12)

(1.1.13)

(1.1.14)

(1.1.15)

(1.1.16)

(1.1.17)

(1.1.18)

(1.1.19)

(1.1.20)

(1.1.21)

Of the above-described monocyclic  $-(C_5-C_7)$  cycloalkenyl groups, that of partial Formula (1.1.12), i.e., cyclohexene, is preferred in the embodiments of the compounds of Formula (1.0.0).

### 5.5 The $R^1$ and $R^2$ Substituents

The Q moiety lies between the linking groups  $-[R^C-C-R^D]_n-$  and  $-[R^A-C-R^B]_m-$  as described in detail above, and said Q moiety is substituted by substituents  $R^1$  and  $R^2$ . The  $R^1$  and  $R^2$  substituents are each a member independently selected from the group consisting of  $-H$ ;  $-F$ ;  $-Cl$ ;  $-R^{12}$ ;  $-OR^{12}$ ;  $-S(=O)_pR^{12}$ ;  $-C(=O)OR^{12}$ ;  $-OC(=O)R^{12}$ ;  $-CN$ ;  $-NO_2$ ;  $-C(=O)NR^{12}R^{13}$ ;  $-OC(=O)NR^{15}R^{12}$ ;  $-NR^{14}C(=O)NR^{15}R^{12}$ ;  $-NR^{14}C(=NR^{14})NR^{15}R^{12}$ ;  $-NR^{14}C(=N-CN)NR^{15}R^{12}$ ;  $-NR^{14}C(=N-NO_2)NR^{15}R^{12}$ ;  $-C(=NR^{14})NR^{15}R^{12}$ ;  $-OC(=NR^{14})NR^{15}R^{12}$ ;  $-OC(=N-NO_2)NR^{15}R^{12}$ ;  $-NR^{15}R^{12}$ ;  $-CH_2NR^{15}R^{12}$ ;  $-NR^{14}C(=O)R^{12}$ ;  $-NR^{14}C(=O)OR^{12}$ ;  $-NR^{14}S(=O)_pR^{13}$ ; and  $-S(=O)_pNR^{12}R^{13}$ ; where p is 0, 1, or 2; and  $R^{12}$ ,  $R^{13}$ ,  $R^{14}$ , and  $R^{15}$  have the same meanings as described above.

In particular, embodiments of the present invention will have a single substituent, i.e., one of  $R^1$  and  $R^2$  will be  $-H$  while the meaning of the other will be as defined above. The single substituent will preferably be selected from  $-H$ ;  $-F$ ;  $-Cl$ ;  $(C_1-C_3)$ alkyl; fluorinated- $(C_1-C_3)$ alkyl;  $(C_1-C_3)$ alkoxy; fluorinated- $(C_1-C_3)$ alkoxy;  $-CN$ ;  $-NO_2$ ;  $-OH$ ; and  $-C(=O)NH_2$ .

Those compounds of the present invention which have a single substituent  $R^1$  or  $R^2$  will preferably have said substituent located at the 2-position, i.e., *ortho*- to the point of attachment of the Q moiety to the linking group  $-[R^C-C-R^D]_n-$ . This is particularly true where the Q moiety is phenyl. In preferred embodiments of the compounds of Formula (1.0.0), the meaning of  $R^1$  or  $R^2$  is defined as -F; fluorinated-( $C_1$ - $C_3$ ) alkyl; or fluorinated-( $C_1$ - $C_3$ ) alkoxy. Among such preferred embodiments of the compounds of Formula (1.0.0), those where  $R^1$  or  $R^2$  has the meaning of -F are especially preferred.

Where  $R^1$  or  $R^2$  is other than -H, it is preferred to have a halogen group at the 2'-position of a phenyl group as the meaning of the substituted Q moiety in embodiments of the compounds of Formula (1.0.2). It is contemplated that  $R^1$  or  $R^2$  is preferably a small lipophilic group, e.g., -F; fluorinated ( $C_1$ - $C_3$ ) alkyl; or fluorinated-( $C_1$ - $C_3$ ) alkoxy. Thus, the meaning of said  $R^1$  or  $R^2$  substituent, as well as of any other substituent of a compound of Formula (1.0.0) that includes the definitions -F; fluorinated ( $C_1$ - $C_3$ ) alkyl; or fluorinated-( $C_1$ - $C_3$ ) alkoxy, is selected from the group consisting of the following:

-F	-CH <sub>2</sub> F	-CHF <sub>2</sub>	-CF <sub>3</sub>	-CH <sub>2</sub> CH <sub>2</sub> F
-CH <sub>2</sub> CHF <sub>2</sub>	-CH <sub>2</sub> CF <sub>3</sub>	-CHFCH <sub>2</sub> F	-CHFCHF <sub>2</sub>	-CHFCHF <sub>2</sub>
-CF <sub>2</sub> CF <sub>2</sub> CF <sub>3</sub>	-O-CH <sub>2</sub> F	-O-CHF <sub>2</sub>	-O-CF <sub>3</sub>	-O-CH <sub>2</sub> CH <sub>2</sub> F
-O-CH <sub>2</sub> CHF <sub>2</sub>	-O-CH <sub>2</sub> CF <sub>3</sub>	-O-CHFCH <sub>2</sub> F	-O-CHFCHF <sub>2</sub>	-O-CHFCHF <sub>2</sub>
-O-CF <sub>2</sub> CH <sub>2</sub> F	-O-CF <sub>2</sub> CHF <sub>2</sub>	-O-CF <sub>2</sub> CF <sub>3</sub>		

The selectivity of the overall molecule which is achieved by utilizing a moiety of this type to be the  $R^1$  or  $R^2$  substituent may be due to the conformational alignment of the lipophilic moiety with a corresponding lipophilic zone in the PDE4 enzyme substrate, or it may be due to the change in the lipophilicity of the overall molecule which results. Whatever the actual mechanism by which such selectivity is achieved, all such embodiments are contemplated to be within the scope of the present invention.

#### 5.6 The Z Group and Its Relationship to the $-[R^A-C-R^B]_m-$ Moiety

As already described above, the moiety  $-[R^A-C-R^B]_m-$  is a linking group that ties together the moieties Q and Z in the compounds of the present invention. Z is thus adjacent to the moiety  $-[R^A-C-R^B]_m-$ , for which, as already discussed, the preferred meaning of m is 1. It is possible to represent this relationship by partial Formula (1.1.7):

(1.1.7)

where " \* " is a symbol representing the point of attachment of the group of partial Formula (1.1.7) to the moiety Q in the remaining portion of a compound of Formula (1.0.0).

### 5.7 The Terminal Moiety Z

Z is independently selected from the group consisting of  $-OR^{12}$ ,  $-C(=O)R^{12}$ , and  $-CN$ ; where  $R^{12}$  has the same meaning as defined herein.

In order to illustrate further meanings of Z that characterize other embodiments of the compounds of Formula (1.0.0), there are depicted below moieties of partial Formulas (3.0.1) through (3.0.24) that represent different meanings that fall within the scope partial Formula (1.1.7):

(1.1.7)

(3.0.1)

(3.0.2)

(3.0.3)

(3.0.4)

(3.0.5)

(3.0.6)

(3.0.7)

(3.0.8)

(3.0.9)

(3.0.10)

(3.0.11)

(3.0.12)

(3.0.13)

(3.0.14)

(3.0.15)

(3.0.16)

(3.0.17)

(3.0.18)

(3.0.19)

Where  $R^A$  and  $R^B$  have the meaning of  $-(C_1-C_6)$  alkyl substituted by 1 or 2 substituents  $R^{10}$ ; and  $Z$  is  $-OR^{12}$ ,  $-C(=O)R^{12}$ , or  $-CN$ , where  $R^{12}$  is  $-H$ ,  $-(C_1-C_4)$  alkyl, or phenyl; the resulting groups fall within the scope of partial Formula (1.1.7) and comprise further embodiments of the compounds of Formula (1.0.0), as illustrated by partial Formulas (3.0.20) through (3.0.24) set out below. As already indicated, where  $Z$  has the meaning of  $-OR^{12}$ , and  $R^A$  and/or  $R^B$  is substituted by  $-OR^{12}$ ,  $-O-C(=O)R^{13}$ , or  $-OC(=O)NR^{12}R^{13}$ , the resulting  $Z$  and  $R^{10}$  substituents: (1)  $-OR^{12}$  and (2)  $-OR^{12}$ ,  $-O-C(=O)R^{13}$ , or  $-OC(=O)NR^{12}R^{13}$ , respectively, may not be attached to adjacent carbon atoms, *i.e.*, be vicinal. This proviso applies to all of the applicable meanings of  $R^A$  and  $R^B$ .

$R^A$  and  $R^B$  are also taken together and have the meaning of a spiro structure that is represented by partial Formula (1.1.0):

(1.1.0)

15

where  $r$  and  $s$  are independently 0 to 4 provided that the sum of  $r + s$  is at least 1, but not greater than 5; and  $Q^A$  is a member selected from the group consisting of  $-CH_2-$ ,  $-CHF$ ,  $-CF_2$ ,  $-NR^{12}-$ ,  $-O-$ , and  $-S(=O)_p-$  where  $p$  is 0, 1, or 2; and said spiro moiety is substituted as to any one or more carbon atoms thereof, including the carbon atom of the group  $-CH_2-$  defining  $Q^A$ , by 0 to 3 substituents  $R^{10}$ ; where both  $R^{10}$  and  $R^{12}$  have the same meaning as defined above.

20

Where said substituent  $R^{10}$  is  $-OR^{12}$ ,  $-O-C(=O)R^{13}$ , or  $-OC(=O)NR^{12}R^{13}$ , it is understood that the positional relationship of said  $-OR^{12}$ ,  $-O-C(=O)R^{13}$ , or  $-OC(=O)NR^{12}R^{13}$  to the  $-OR^{12}$  radical that is a meaning of  $Z$ , must be other than a vicinal one. It will be further appreciated that the carbon atom of the group  $-CH_2-$  defining  $Q^A$ , is substituted by 0 to 3 substituents  $R^{10}$ , and that  $R^{10}$  may have the meaning of  $-F$ . Accordingly, since the meanings of  $Q^A$  as  $-CHF$  or  $-CF_2$  have already been provided for, it will be understood that  $-CH_2-$  substituted by 1 or 2  $R^{10}$  where  $R^{10}$  is  $-F$  does not apply.

25

The resulting groups fall within the scope of partial Formula (1.1.7) above and comprise further embodiments of the compounds of Formula (1.0.0), as illustrated by partial Formulas (4.0.1) through (4.0.37):

In the above description various preferred aspects of the compounds of Formula (1.0.0) have been set forth. As a further demonstration of the scope and the content of the present invention, specific compounds comprising embodiments of the compounds of Formula (1.0.0) are presented. Such species of Formula (1.0.0) include, but are not limited to the following compounds of Formulas (5.5.1) through (5.5.66):

No.	NOMENCLATURE	STRUCTURAL FORMULA
(5.5.1)	2-[Benzo[2,1,3]oxadiazol-5-yl-oxy]-N-[4-[1-hydroxy-1-methyl-ethyl]-benzyl]-nicotinamide	
(5.5.2)	2-[Benzo[2,1,3]oxadiazol-5-yl-oxy]-N-[2-fluoro-4-[1-hydroxy-1-methyl-ethyl]-benzyl]-nicotinamide	
(5.5.3)	<i>Trans</i> -2-[Benzo[2,1,3]oxadiazol-5-yl-oxy]-N-[4-[1-hydroxy-1-methyl-ethyl]-cyclohexyl-methyl]-nicotinamide	
(5.5.4)	2-(Benzo[2,1,3]oxadiazol-5-yl-oxy)-N-[4-(1-hydroxy-cyclobutyl)-benzyl]-nicotinamide	
(5.5.5)	(±)-2-[Benzo[2,1,3]oxadiazol-5-yl-oxy]-N-[4-[2,2,2-trifluoro-1-hydroxy-ethyl]-benzyl]-nicotinamide	

(5.5.6)	(±)-2-[Benzo[2,1,3]oxadiazol-5-yl-oxy]-N-[5-[1-hydroxy-ethyl]-thiophen-2-yl-methyl]-nicotinamide	
(5.5.7)	N-[4-Acetyl-benzyl]-2-[benzo[2,1,3]oxadiazol-5-yl-oxy]-nicotinamide	
(5.5.8)	(±)-2-(Benzo[2,1,3]oxadiazol-5-yl-oxy)-N-{1-[2-fluoro-4-(1-hydroxy-1-methyl-ethyl)-phenyl]-ethyl}-nicotinamide	
(5.5.9)	2-(Benzo[2,1,3]oxadiazol-5-yl-oxy)-N-[2-chloro-4-(1-hydroxy-1-methyl-ethyl)-benzyl]-nicotinamide	
(5.5.10)	(±)-2-(Benzo[2,1,3]oxadiazol-5-yl-oxy)-N-[4-(1-hydroxy-ethyl)-benzyl]-nicotinamide	
(5.5.11)	(-)-2-(Benzo[2,1,3]oxadiazol-5-yl-oxy)-N-{1-[4-(1-hydroxy-1-methyl-ethyl)-phenyl]-ethyl}-nicotinamide	

(5.5.12)	(+)-2-(Benzo[2,1,3]oxadiazol-5-yl-oxy)-N-{1-[4-(1-hydroxy-1-methyl-ethyl)-phenyl]-ethyl}-nicotinamide	
(5.5.13)	(+)-2-(Benzo[2,1,3]oxadiazol-5-yl-oxy)-N-[4-(1-hydroxy-1-methyl-ethyl)-cyclohex-1-enylmethyl]-nicotinamide	
(5.5.14)	(-)-2-(Benzo[2,1,3]oxadiazol-5-yl-oxy)-N-[4-(1-hydroxy-1-methyl-ethyl)-cyclohex-1-enylmethyl]-nicotinamide	
(5.5.15)	2-(Benzo[2,1,3]oxadiazol-5-yl-oxy)-N-[4-(1-hydroxy-cyclopropyl)-benzyl]-nicotinamide	
(5.5.16)	2-(Benzo[2,1,3]oxadiazol-5-yl-oxy)-N-[2-fluoro-4-(1-hydroxy-cyclopropyl)-benzyl]-nicotinamide

(5.5.50)	(±)-2-(Benzo[2,1,3]oxadiazol-5-yl-thio)-N-{1-[2-fluoro-4-(1-hydroxy-1-methyl-ethyl)-phenyl]-ethyl}-nicotinamide	
(5.5.51)	2-(Benzo[2,1,3]oxadiazol-5-yl-thio)-N-[2-fluoro-4-(1-hydroxy-cyclopropyl)-benzyl]-nicotinamide	

(5.5.52)	2-[Benzo[2,1,3]thiadiazol-5-yl-thio]-N-[4-[1-hydroxy-1-methyl-ethyl]-benzyl]-nicotinamide	
(5.5.53)	2-[2-Methyl-benzo[1,2,3]triazol-5-yl-thio]-N-[2-fluoro-4-[1-hydroxy-1-methyl-ethyl]-benzyl]-nicotinamide	
(5.5.54)	2-[Benzo[2,1,3]oxadiazol-5-yl-thio]-N-[4-[1-hydroxy-1-methyl-ethyl]-cyclopent-1-enyl-methyl]-nicotinamide	
(5.5.55)	2-[Benzo[2,1,3]oxadiazol-5-yl-thio]-N-[3-[1-hydroxy-1-methyl-ethyl]-7-fluoro-norborn-5-en-6-yl-methyl]-nicotinamide	
(5.5.56)	(±)-2-[Benzo[2,1,3]oxadiazol-5-yl-thio]-N-[5-[1-hydroxy-ethyl]-furan-2-yl-methyl]-nicotinamide	

(5.5.57)	2-[Benzo[2,1,3]oxadiazol-5-yl-thio]-N-[5-[1-hydroxy-1-methyl-ethyl]-pyridin-2-yl-methyl]-nicotinamide	
(5.5.58)	2-[Benzo[2,1,3]oxadiazol-5-yl-thio]-N-[5-[1-hydroxy-1-methyl-ethyl]-oxazol-2-yl-methyl]-nicotinamide	
(5.5.59)	2-[Benzo[2,1,3]thiadiazol-5-yl-oxy]-N-[4-[1-hydroxy-1-methyl-ethyl]-cyclopent-1-enyl-methyl]-nicotinamide	
(5.5.60)	2-[2-Methyl-benzo[1,2,3]triazol-5-yl-oxy]-N-[3-[1-hydroxy-1-methyl-ethyl]-norbornan-6-yl-methyl]-nicotinamide	
(5.5.61)	2-[Benzo[2,1,3]thiadiazol-5-yl-thio]-N-[3-[1-hydroxy-1-methyl-ethyl]-7-fluoro-norborn-5-en-6-yl-methyl]-nicotinamide	

(5.5.62)	2-[2-Methyl-benzo[1,2,3]triazol-5-yl-oxy]-N-[3-acetyl-bicyclo[2.2.2]oct-7-en-5-yl-methyl]-nicotinamide	
(5.5.63)	(±)-2-[Benzo[2,1,3]thiadiazol-5-yl-oxy]-N-[5-[1-hydroxy-ethyl]-furan-2-yl-methyl]-nicotinamide	
(5.5.64)	2-[2-Methyl-benzo[1,2,3]triazol-5-yl-oxy]-N-[5-[1-hydroxy-1-methyl-ethyl]-pyridin-2-yl-methyl]-nicotinamide	

**DETAILED DESCRIPTION OF THE INVENTION****6.0 Processes for Making the Compounds of Formula (1.0.0)**

- 5 A method suitable for making the compounds of Formula (1.0.0) where the moiety Q is, in particular, phenyl, and R<sup>5</sup> and R<sup>6</sup> are taken together to form a moiety of partial Formula (1.1.1), of partial Formula (1.1.4), or of partial Formula (1.1.5):

(1.1.1)

(1.1.4)

(1.1.5)

- 10 is illustrated in Synthesis Scheme (10.0.0) below.

## SYNTHESIS SCHEME (10.0.0)

where R is a carboxyl protecting group, especially a lower alkyl ester; Q<sup>1</sup> is -O-, -S-, or  
 5 -N(R<sup>7</sup>)-; R<sup>A</sup>, R<sup>B</sup>, R<sup>C</sup>, R<sup>D</sup>, R<sup>1</sup>, R<sup>2</sup>, R<sup>4</sup>, Z, m, and n have the same meaning as defined herein;  
 THF is tetrahydrofuran; DMF is dimethylformamide; EDCI is 1-[3-(dimethylamino)propyl]-3-  
 ethylcarbodiimide hydrochloride; and HOBT is 1-hydroxybenzotriazole hydrate.

In Step 1 of Synthesis Scheme (10.0.0), a protected 2-chloro nicotinic acid is treated  
 with 5-hydroxybenzofurazan, *i.e.*, 5-hydroxy-benzo[2,1,3]oxadiazole in order to prepare a  
 10 compound where Q<sup>1</sup> is -O-. Correspondingly, in order to prepare a compound where Q<sup>1</sup> is -  
 S-, 5-hydroxybenzo[1,3,2]thiadiazole is employed, and 5-hydroxybenzo[1,2,3]triazole is used  
 to prepare a compound where Q<sup>1</sup> is -N(R<sup>7</sup>)- and R<sup>7</sup> is -H. The carboxyl group of the 2-  
 chloro nicotinic acid starting material is protected, *e.g.*, by using it in the form of one of its  
 15 alkyl esters, preferably the ethyl ester. Other commonly used carboxyl protecting groups are  
 also suitable.

In Step 1 a protected 2-chloro nicotinic acid and 5-hydroxybenzofurazan are reacted in the presence of cesium carbonate,  $\text{Cs}_2\text{CO}_3$ , using dry *N,N*-dimethylformamide (DMF) as a solvent. This reaction is a well-known procedure for preparing asymmetrical ethers by an aryloxy halogen displacement mechanism. Other strong bases, e.g., NaOH, KOH, NaH, 5. *t*BuOK (potassium *tert*-butoxide), or  $\text{K}_2\text{CO}_3$ , may be used instead of  $\text{Cs}_2\text{CO}_3$ . Other aprotic, polar solvents may be used instead of dimethylformamide, e.g., acetone; nitromethane; acetonitrile; sulfolane; dimethylsulfoxide (DMSO); *N*-methylpyrrolidinone (NMP); methyl ethyl ketone (2-butanone); or tetrahydrofuran (THF). The most preferred solvent is *N,N*-dimethylformamide (DMF).

10 After the above-described reaction mixture is formed, it is heated to from 70° to 110°C, usually from 80° to 100°C, and most usually 90°C. It is necessary to heat the reaction mixture at the lower above-recited temperatures for a considerable period of time, from 1 to 6 days, preferably from 2 to 5 days, most preferably 3 or 4 days. At the higher above-recited temperatures, the reaction proceeds more rapidly, and shorter periods of time are required, 15 from ½ to 5 days, usually ¾ to 3 days, and most typically from 1 to 2 days.

In Step 2 of Synthesis Scheme (10.0.0), the protected 2-(benzo[2,1,3]oxadiazol-5-yloxy) nicotinic acid, e.g., the ethyl ester prepared in Step 1 is deprotected by treating it with a mild base such as lithium hydroxide, LiOH, in an aprotic solvent, e.g., 1,4-dioxane, dimethoxyethane (DME), or tetrahydrofuran (THF), preferably tetrahydrofuran (THF). The 20 reaction can be carried out at room temperature for from 8 to 24 hours, usually 10 to 20 hours, more usually 12 hours.

In Step 3 of Synthesis Scheme (10.0.0), the 2-(benzo[2,1,3]oxadiazol-5-yloxy) nicotinic acid prepared in Step 2, which forms the left-hand side of a compound of Formula (1.0.0) is reacted with a compound which is to form the right-hand side of a compound of 25 Formula (1.0.0). This compound is in the form of an amine, and the result is an amide linkage that joins the two halves of a compound of Formula (1.0.0). The reaction is carried out using a mixture of the coupling reagents 1-[3-(dimethylamino)propyl]-3-ethylcarbodiimide hydrochloride (EDCI), and 1-hydroxybenzotriazole hydrate (HOBT). Other coupling reagents, e.g., dicyclohexylcarbodiimide (DCCI), *N,N'*-carbonyldiimidazole, and benzotriazol-1-yl diethyl 30 phosphate, may also be used.

The coupling reaction is carried out in an aprotic, polar solvent, e.g., acetone; nitromethane; *N,N*-dimethylformamide (DMF); acetonitrile; sulfolane; dimethylsulfoxide (DMSO); *N*-methylpyrrolidinone (NMP); or methyl ethyl ketone (2-butanone). *N,N*-dimethylformamide (DMF) is preferred. The reaction is carried out at room temperature to slightly above room 35 temperature, and for a period of from 8 to 24 hours, usually 10 to 20 hours, more usually 12 hours.

**DETAILED DESCRIPTION OF THE INVENTION****7.0 Pharmaceutical Salts and Other Forms**

5 The above-described compounds of the present invention may be utilized in the form of acids, esters, or other chemical classes of compounds to which the compounds described belong. It is also within the scope of the present invention to utilize those compounds in the form of their pharmaceutically acceptable salts derived from various organic and inorganic acids and bases in accordance with procedures well known in the art.

10 Pharmaceutically acceptable salt forms of the compounds of Formula (1.0.0) are prepared for the most part by conventional means. Where the compound of Formula (1.0.0) contains a carboxylic acid group, a suitable salt thereof may be formed by reacting the compound with an appropriate base to provide the corresponding base addition salt. Examples of such bases are alkali metal hydroxides including potassium hydroxide, sodium hydroxide, and lithium hydroxide; alkaline earth metal hydroxides such as barium hydroxide and calcium hydroxide; alkali metal alkoxides, e.g., potassium ethanolate and sodium propanolate; and various organic bases such as piperidine, diethanolamine, and *N*-methylglutamine. Also included are the aluminum salts of the compounds of Formula (1.0.0).

20 For certain compounds of Formula (1.0.0) acid addition salts may be formed by treating said compounds with pharmaceutically acceptable organic and inorganic acids, e.g., hydrohalides such as hydrochloride, hydrobromide, hydroiodide; other mineral acids and their corresponding salts such as sulfate, nitrate, phosphate, etc.; and alkyl- and mono-arylsulfonates such as ethanesulfonate, toluenesulfonate, and benzenesulfonate; and other organic acids and their corresponding salts such as acetate, tartrate, maleate, succinate, citrate, benzoate, salicylate, ascorbate, etc.

25 Accordingly, the pharmaceutically acceptable acid addition salts of the compounds of Formula (1.0.0) include, but are not limited to: acetate, adipate, alginate, arginate, aspartate, benzoate, benzenesulfonate (besylate), bisulfate, bisulfite, bromide, butyrate, camphorate, camphorsulfonate, caprylate, chloride, chlorobenzoate, citrate, cyclopentanepropionate, digluconate, dihydrogenphosphate, dinitrobenzoate, dodecylsulfate, ethanesulfonate, 30 fumarate, galactate (from mucic acid), galacturonate, glucoheptanoate, gluconate, glutamate, glycerophosphate, hemisuccinate, hemisulfate, heptanoate, hexanoate, hippurate, hydrochloride, hydrobromide, hydroiodide, 2-hydroxyethanesulfonate, iodide, isethionate, *iso*-butyrate, lactate, lactobionate, malate, maleate, malonate, mandelate, metaphosphate, methanesulfonate, methylbenzoate, monohydrogenphosphate, 2-naphthalenesulfonate, 35 nicotinate, nitrate, oxalate, oleate, pamoate, pectinate, persulfate, phenylacetate, 3-phenylpropionate, phosphate, phosphonate, phthalate,.

Further, base salts of the compounds of the present invention include, but are not limited to aluminum, ammonium, calcium, copper, ferric, ferrous, lithium, magnesium, manganic, manganous, potassium, sodium, and zinc salts. Preferred among the above-recited salts are ammonium; the alkali metal salts sodium and potassium; and the alkaline earth metal salts calcium and magnesium. Salts of the compounds of Formula (1.0.0) derived from pharmaceutically acceptable organic non-toxic bases include, but are not limited to salts of primary, secondary, and tertiary amines, substituted amines including naturally occurring substituted amines, cyclic amines, and basic ion exchange resins, e.g., arginine, betaine, caffeine, chlorprocaine, choline, *N,N'*-dibenzylethylenediamine (benzathine), dicyclohexylamine, diethanolamine, diethylamine, 2-diethylaminoethanol, 2-dimethylaminoethanol, ethanolamine, ethylenediamine, *N*-ethylmorpholine, *N*-ethylpiperidine, glucamine, glucosamine, histidine, hydrabamine, *iso*-propylamine, lidocaine, lysine, meglumine, *N*-methyl-D-glucamine, morpholine, piperazine, piperidine, polyamine resins, procaine, purines, theobromine, triethanolamine, triethylamine, trimethylamine, tripropylamine, and tris-(hydroxymethyl)-methamine (tromethamine).

Compounds of the present invention which comprise basic nitrogen-containing groups may be quaternized with such agents as (C<sub>1</sub>-C<sub>4</sub>) alkyl halides, e.g., methyl, ethyl, *iso*-propyl and *tert*-butyl chlorides, bromides and iodides; di(C<sub>1</sub>-C<sub>4</sub>) alkyl sulfate, e.g., dimethyl, diethyl and diamyl sulfates; (C<sub>10</sub>-C<sub>18</sub>) alkyl halides, e.g., decyl, dodecyl, lauryl, myristyl and stearyl chlorides, bromides and iodides; and aryl-(C<sub>1</sub>-C<sub>4</sub>) alkyl halides, e.g., benzyl chloride and phenethyl bromide. Such salts permit the preparation of both water-soluble and oil-soluble compounds of the present invention.

Among the above-recited pharmaceutical salts those which are preferred include, but are not limited to acetate, besylate, citrate, fumarate, gluconate, hemisuccinate, hippurate, hydrochloride, hydrobromide, isethionate, mandelate, meglumine, nitrate, oleate, phosphonate, pivalate, sodium phosphate, stearate, sulfate, sulfosalicylate, tartrate, thiomalate, tosylate, and tromethamine.

The acid addition salts of basic compounds of Formula (1.0.0) are prepared by contacting the free base form with a sufficient amount of the desired acid to produce the salt in the conventional manner. The free base may be regenerated by contacting the salt form with a base and isolating the free base in the conventional manner. The free base forms differ from their respective salt forms somewhat in certain physical properties such as solubility in polar solvents, but otherwise the salts are equivalent to their respective free base forms for purposes of the present invention.

As indicated, the pharmaceutically acceptable base addition salts of the compounds of Formula (1.0.0) are formed with metals or amines, such as alkali metals and alkaline earth

metals, or organic amines. Preferred metals are sodium, potassium, magnesium, and calcium. Preferred organic amines are *N,N'*-dibenzylethylenediamine, chlorprocaine, choline, diethanolamine, ethylenediamine, *N*-methyl-D-glucamine, and procaine.

5       The base addition salts of acidic compounds of the present invention are prepared by contacting the free acid form with a sufficient amount of the desired base to produce the salt in the conventional manner. The free acid form may be regenerated by contacting the salt form with an acid and isolating the free acid form in the conventional manner. The free acid forms differ from their respective salt forms somewhat in physical properties such as solubility in polar solvents, but otherwise the salts are equivalent to their respective free acid forms for  
10       purposes of the present invention.

Multiple salts forms are included within the scope of the present invention where a compound of the present invention contains more than one group capable of forming such pharmaceutically acceptable salts. Examples of typical multiple salt forms include, but are not limited to bitartrate, diacetate, difumarate, dimeglumine, diphosphate, disodium, and  
15       trihydrochloride.

In light of the above, it can be seen that the expression "pharmaceutically acceptable salt" as used herein is intended to mean an active ingredient comprising a compound of Formula (1.0.0) utilized in the form of a salt thereof, especially where said salt form confers on said active ingredient improved pharmacokinetic properties as compared to the free form of  
20       said active ingredient or some other salt form of said active ingredient utilized previously. The pharmaceutically acceptable salt form of said active ingredient may also initially confer a desirable pharmacokinetic property on said active ingredient which it did not previously possess, and may even positively affect the pharmacodynamics of said active ingredient with respect to its therapeutic activity in the body.

25       The pharmacokinetic properties of said active ingredient which may be favorably affected include, e.g., the manner in which said active ingredient is transported across cell membranes, which in turn may directly and positively affect the absorption, distribution, biotransformation and excretion of said active ingredient. While the route of administration of the pharmaceutical composition is important, and various anatomical, physiological and  
30       pathological factors can critically affect bioavailability, the solubility of said active ingredient is usually dependent upon the character of the particular salt form thereof which it utilized. Further, as the artisan will appreciate, an aqueous solution of said active ingredient will provide the most rapid absorption of said active ingredient into the body of a patient being treated, while lipid solutions and suspensions, as well as solid dosage forms, will result in less  
35       rapid absorption of said active ingredient.

Oral ingestion of an active ingredient of Formula (1.0.0) is the most preferred route of administration for reasons of safety, convenience, and economy, but absorption of such an oral dosage form can be adversely affected by physical characteristics such as polarity, emesis caused by irritation of the gastrointestinal mucosa, destruction by digestive enzymes and low pH, irregular absorption or propulsion in the presence of food or other drugs, and metabolism by enzymes of the mucosa, the intestinal flora, or the liver. Formulation of said active ingredient into different pharmaceutically acceptable salt forms may be effective in overcoming or alleviating one or more of the above-recited problems encountered with absorption of oral dosage forms.

A compound of Formula (1.0.0) prepared in accordance with the methods described herein can be separated from the reaction mixture in which it is finally produced by any ordinary means known to the chemist skilled in the preparation of organic compounds. Once separated said compound can be purified by known methods. Various methods and techniques can be used as the means for separation and purification, and include, e.g., distillation; recrystallization; column chromatography; ion-exchange chromatography; gel chromatography; affinity chromatography; preparative thin-layer chromatography; and solvent extraction.

#### 7.1 Stereoisomers

A compound within the scope of Formula (1.0.0) may be such that its constituent atoms are capable of being arranged in space in two or more different ways, despite having identical connectivities. As a consequence, said compound exists in the form of stereoisomers. *Cis-trans* isomerism is but one type of stereoisomerism. Where the stereoisomers are nonsuperimposable mirror images of each other, they are enantiomers which have chirality or handedness, because of the presence of one or more asymmetric carbon atoms in their constituent structure. Enantiomers are optically active and therefore distinguishable because they rotate the plane of polarized light by equal amounts, but in opposite directions.

Where two or more asymmetric carbon atoms are present in a compound of Formula (1.0.0), there are two possible configurations at each said carbon atom. Where two asymmetric carbon atoms are present, for example, there are four possible stereoisomers. Further, these four possible stereoisomers may be arranged into six possible pairs of stereoisomers that are different from each other. In order for a pair of molecules with more than one asymmetric carbon to be enantiomers, they must have different configurations at every asymmetric carbon. Those pairs that are not related as enantiomers have a different stereochemical relationship referred to as a diastereomeric relationship. Stereoisomers that are not enantiomers are called diastereoisomers, or more commonly, diastereomers.

All of these well known aspects of the stereochemistry of the compounds of Formula (1.0.0) are contemplated to be a part of the present invention. Within the scope of the present invention there is thus included compounds of Formula (1.0.0) that are stereoisomers, and where these are enantiomers, the individual enantiomers, racemic mixtures of said enantiomers, and artificial, i.e., manufactured mixtures containing proportions of said enantiomers that are different from the proportions of said enantiomers found in a racemic mixture. Where a compound of Formula (1.0.0) comprises stereoisomers that are diastereomers, there is included within the scope of said compound the individual diastereomers as well as mixtures of any two or more of said diastereomers in any proportions thereof.

By way of illustration, in the case where there is a single asymmetric carbon atom in a compound of Formula (1.0.0), resulting in the (-)(R) and (+)(S) enantiomers thereof; there is included within the scope of said compound all pharmaceutically acceptable salt forms, prodrugs and metabolites thereof which are therapeutically active and useful in treating or preventing the diseases and conditions described further herein. Where a compound of Formula (1.0.0) exists in the form of (-)(R) and (+)(S) enantiomers, there is also included within the scope of said compound the (+)(S) enantiomer alone, or the (-)(R) enantiomer alone, in the case where all, substantially all, or a predominant share of the therapeutic activity resides in only one of said enantiomers, and/or unwanted side effects reside in only one of said enantiomers. In the case where there is substantially no difference between the biological activities of both enantiomers, there is further included within the scope of said compound of Formula (1.0.0) the (+)(S) enantiomer and the (-)(R) enantiomer present together as a racemic mixture or as a non-racemic mixture in any ratio of proportionate amounts thereof.

For example, the particular biological activities and/or physical and chemical properties of a pair or set of enantiomers of a compound of Formula (1.0.0) where such exist, may suggest use of said enantiomers in certain ratios to constitute a final therapeutic product. By way of illustration, in the case where there is a pair of enantiomers, they may be employed in ratios such as 90% (R) - 10% (S); 80% (R) - 20% (S); 70% (R) - 30% (S); 60% (R) - 40% (S); 50% (R) - 50% (S); 40% (R) - 60% (S); 30% (R) - 70% (S); 20% (R) - 80% (S); and 10% (R) - 90% (S). After evaluating the properties of the various enantiomers of a compound of Formula (1.0.0) where such exist, the proportionate amount of one or more of said enantiomers with certain desired properties that will constitute the final therapeutic product can be determined in a straightforward manner.

## 7.2 Isotopes

There is further contemplated to be included within the scope of a compound of Formula (1.0.0) isotopically-labelled forms thereof. An isotopically-labelled form of a compound of Formula (1.0.0) is identical to said compound but for the fact that one or more atoms of said compound have been replaced by an atom or atoms having an atomic mass or mass number different from the atomic mass or mass number of said atom which is usually found in nature. Examples of isotopes which are readily available commercially and which can be incorporated into a compound of Formula (1.0.0) in accordance with well established procedures, include isotopes of hydrogen, carbon, nitrogen, oxygen, phosphorous, fluorine and chlorine, e.g.,  $^2\text{H}$ ,  $^3\text{H}$ ,  $^{13}\text{C}$ ,  $^{14}\text{C}$ ,  $^{15}\text{N}$ ,  $^{18}\text{O}$ ,  $^{17}\text{O}$ ,  $^{31}\text{P}$ ,  $^{32}\text{P}$ ,  $^{35}\text{S}$ ,  $^{18}\text{F}$ , and  $^{36}\text{Cl}$ , respectively. A compound of Formula (1.0.0), a prodrug thereof, or a pharmaceutically acceptable salt of either which contains one or more of the above-mentioned isotopes and/or other isotopes of other atoms is contemplated to be within the scope of the present invention.

An isotopically-labelled compound of Formula (1.0.0) may be used in a number of beneficial ways. For example, an isotopically-labelled compound of Formula (1.0.0), e.g., one in which a radioactive isotope such as  $^3\text{H}$  or  $^{14}\text{C}$  has been incorporated, will be useful in drug and/or substrate tissue distribution assays. These radioactive isotopes, i.e., tritium,  $^3\text{H}$ , and carbon-14,  $^{14}\text{C}$ , are especially preferred for their ease of preparation and eminent detectability. Incorporation of heavier isotopes, e.g., deuterium,  $^2\text{H}$ , into a compound of Formula (1.0.0) will provide therapeutic advantages based on the greater metabolic stability of said isotopically-labelled compound. Greater metabolic stability translates directly into increased *in vivo* half-life or reduced dosage requirements, which under most circumstances would constitute a preferred embodiment of the present invention. An isotopically-labelled compound of Formula (1.0.0) can usually be prepared by carrying out the procedures disclosed in the Synthesis Schemes and related description, Examples, and Preparations herein, substituting a readily available isotopically-labelled reagent for its corresponding non-isotopically-labelled reagent.

Deuterium,  $^2\text{H}$ , can also be incorporated into a compound of Formula (1.0.0) for the purpose of manipulating the oxidative metabolism of said compound by way of the primary kinetic isotope effect. The primary kinetic isotope effect is a change of rate for a chemical reaction that results from substitution of isotopic nuclei, which in turn is caused by the change in ground state energies required for covalent bond formation subsequent to said isotopic substitution. Substitution of a heavier isotope will usually result in a lowering of the ground state energy for a chemical bond, thereby causing a reduction in rate for a rate-limiting bond breaking step. If the bond-breaking event occurs on or near a saddle-point region along the coordinate of a multi-product reaction, the product distribution ratios can be altered

substantially. By way of illustration, when deuterium is bound to a carbon atom at a non-exchangeable site, rate differences of  $k_M/k_D = 2-7$  are typical. This difference in rate, applied successfully to an oxidatively labile compound of Formula (1.0.0), can dramatically affect the profile of said compound *in vivo* and result in improved pharmacokinetic properties.

5 In discovering and developing therapeutic agents, the skilled artisan seeks to optimize pharmacokinetic parameters while retaining desirable *in vitro* properties. It is a reasonable surmise that many compounds with poor pharmacokinetic profiles suffer from a lability to oxidative metabolism. *In vitro* liver microsomal assays now available provide  
10 valuable information about the course of this oxidative metabolism, which in turn permits the rational design of deuterated compounds of Formula (1.0.0) with improved stability through resistance to such oxidative metabolism. Significant improvements in the pharmacokinetic profiles of compounds of Formula (1.0.0) are thereby obtained, and can be expressed quantitatively in terms of increases in *in vivo* half-life ( $t_{1/2}$ ), concentration at maximum therapeutic effect ( $C_{max}$ ), area under the dose response curve (AUC), and F; and in terms of  
15 decreases in clearance, dose, and cost-of-goods.

By way of illustration of the above, a compound of Formula (1.0.0) which has multiple potential sites for oxidative metabolism, e.g., benzylic hydrogen atoms and hydrogen atoms  $\alpha$  to a nitrogen atom, is prepared as a series of analogs in which various combinations of hydrogen atoms are replaced by deuterium atoms so that some, most or all of said hydrogen  
20 atoms are replaced with deuterium atoms. Half-life determinations provide an expedient and accurate determination of the extent of improvement in resistance to oxidative metabolism. In this manner it is determined that the half-life of the parent compound can be extended by as much as 100% as the result of such deuterium-for-hydrogen substitution.

Deuterium-for-hydrogen substitution in a compound of Formula (1.0.0) can also be  
25 used to achieve a favorable alteration in the metabolite profile of the parent compound as a way of diminishing or eliminating unwanted toxic metabolites. For example, where a toxic metabolite arises through an oxidative carbon-hydrogen, C-H, bond scission, the deuterated analog is reasonably expected to greatly diminish or eliminate production of the unwanted metabolite, even in the case where the particular oxidation is not a rate-determining step.

30 Further information concerning the state of the art with respect to deuterium-for-hydrogen substitution may be found, e.g., in Hanzlik *et al.*, *J. Org. Chem.* 55 3992-3997, 1990; Reider *et al.*, *J. Org. Chem.* 52 3326-3334, 1987; Foster, *Adv. Drug Res.* 14 1-40, 1985; Gillette *et al.*, *Biochemistry* 33(10) 2927-2937, 1994; and Jarman *et al.*, *Carcinogenesis* 16(4) 683-688, 1993.

**DETAILED DESCRIPTION OF THE INVENTION****8.0 Therapeutic Applications and Clinical Endpoints**

The description which follows concerns the therapeutic applications to which the compounds of Formula (1.0.0) may be put, and where applicable an explanation of the clinical endpoints associated with such therapeutic applications. There is also set forth a disclosure of various *in vitro* assays and animal model experiments, which are capable of providing data sufficient to define and demonstrate the therapeutic utility of the compounds of Formula (1.0.0).

The therapeutic utility of the compounds of Formula (1.0.0) is applicable to a patient or subject afflicted with a disease or condition as herein set forth and therefore in need of such treatment. The beneficial results are therapeutic whether administered to animals or humans. As used herein the terms "animal" and "animals" is used merely for the purpose of pointing out human beings as opposed to other members of the animal kingdom. The compounds of Formula (1.0.0) have therapeutic applicability in the treatment of mammals, and in particular of humans. All of the major subdivisions of the class of mammals (*Mammalia*) are included within the scope of the present invention with regard to being recipients of therapeutic treatment as described herein. Mammals have value as pets to humans and are therefore likely to be subjects of treatment. This applies especially to the canine and feline groups of mammals. Other mammals are valued as domesticated animals and their treatment in accordance with the present invention is likely in view of the adverse economic impact of not treating the diseases and conditions described herein. This applies especially to the equine, bovine, porcine, and ovine groups of mammals.

The compounds of Formula (1.0.0) inhibit the PDE4 isozyme and thereby have a wide range of therapeutic applications, as described further below, because of the essential role which the PDE4 family of isozymes plays in the physiology of all mammals. The enzymatic role performed by the PDE4 isozymes is the intracellular hydrolysis of adenosine 3',5'-monophosphate (cAMP) within pro-inflammatory leukocytes. cAMP, in turn, is responsible for mediating the effects of numerous hormones in the body, and as a consequence, PDE4 inhibition plays a significant role in a variety of physiological processes. There is extensive literature in the art describing the effects of PDE inhibitors on various inflammatory cell responses, which in addition to cAMP elevation, include inhibition of superoxide production, degranulation, chemotaxis and tumor necrosis factor (TNF) release in eosinophils, neutrophils and monocytes.

PDE4 was first identified in 1985, Nemoz *et al. Biochem. Pharmacol.* **34** 2997-3000, 1985, and the PDE4 inhibitors rolipram and denbufylline were studied early on in clinical trials for CNS indications such as depression. Subsequently, it was established that PDE4 is the

principal phosphodiesterase in inflammatory leukocytes. The four subtypes of PDE4, i.e., PDE4A, PDE4B, PDE4C, and PDE4D, are widely distributed in human tissues, as determined by the presence of their mRNAs. PDE4D is expressed in kidney, thymus, small intestine, and colon tissues, and is strongly expressed in brain, lung, skeletal muscle, prostate, and peripheral blood leukocyte (PBL) tissues. It is only weakly expressed in heart, placenta, liver, pancreas, spleen, testes, and ovary tissues. PDE4A and PDE4B are also strongly expressed in brain and skeletal muscle tissues, and only weakly expressed in placenta, liver, and ovary tissues. PDE4C is strongly expressed in skeletal muscle tissue as well, and is also weakly expressed in ovary tissue. PDE4C is usually not detectable in the majority of the above-mentioned tissues.

The PDE4 family of isozymes is the predominant form of phosphodiesterase found in cell types implicated in chronic inflammatory diseases, and among bone-marrow derived cell types, only platelets do not express PDE. PDE4 is the major cAMP-metabolizing enzyme in immune and inflammatory cells, and is one of two major cAMP-metabolizing enzymes in airway smooth muscle. PDE4 is exclusively present in neutrophils, eosinophils, basophils, and monocytes, while in macrophages PDE3 and PDE1 activity, and in T lymphocytes PDE7 activity has also been demonstrated. The beneficial anti-inflammatory effects of inhibitors of PDE have been demonstrated heretofore using *in vitro* experiments, which have established that such compounds inhibit superoxide generation in human monocytes, eosinophils, and neutrophils; mediator release in basophils, macrophages, and neutrophils; and TNF $\alpha$  release in monocytes and macrophages. PDE inhibitors also inhibit mediator release of inflammatory cells like monocytes and monocyte-derived macrophages, lung mast cells, T lymphocytes, B lymphocytes, alveolar macrophages, and eosinophils.

Beneficial anti-inflammatory effects have also been observed *in vivo* heretofore, including inhibition of microvascular leakage into the lungs of sensitized guinea pigs, and reduction of bronchial hyper-reactivity and eosinophilia in cynomolgus monkeys following repeated antigen challenge. It has also been demonstrated heretofore that PDE4 inhibitors potently suppress TNF $\alpha$  release from mononuclear phagocytes.

### 8.1 Asthma

One of the most important respiratory diseases treatable with PDE4 inhibitors of the type within the scope of the compounds of Formula (1.0.0) is asthma, a chronic, increasingly common disorder encountered worldwide and characterized by intermittent reversible airway obstruction, airway hyper-responsiveness and inflammation. The cause of asthma has yet to be determined, but the most common pathological expression of asthma is inflammation of the airways, which may be significant even in the airways of patients with mild asthma. Based on bronchial biopsy and lavage studies it has been clearly shown that asthma involves

infiltration by mast cells, eosinophils, and T-lymphocytes into a patient's airways. Bronchoalveolar lavage (BAL) in atopic asthmatics shows activation of interleukin (IL)-3, IL-4, IL-5 and granulocyte/macrophage-colony stimulating factor (GM-CSF) that suggests the presence of a T-helper 2 (Th-2)-like T-cell population.

5           Compounds of Formula (1.0.0) inhibit PDE4 in human eosinophils and are therefore useful in the treatment of atopic and non-atopic asthma. The term "atopy" refers to a genetic predisposition toward the development of type I (immediate) hypersensitivity reactions against common environmental antigens. The most common clinical manifestation is allergic rhinitis, while bronchial asthma, atopic dermatitis, and food allergy occur less frequently. Accordingly, 10   the expression "atopic asthma" as used herein is intended to be synonymous with "allergic asthma", i.e., bronchial asthma which is an allergic manifestation in a sensitized person. The term "non-atopic asthma" as used herein is intended to refer to all other asthmas, especially essential or "true" asthma, which is provoked by a variety of factors, including vigorous exercise, irritant particles, psychologic stresses, etc.

15           The use of the compounds of Formula (1.0.0) to treat atopic asthma or non-atopic asthma is established and demonstrated by the models of PDE inhibition, inhibition of eosinophil activation, and the bronchodilator models described below.

PDE Isozyme Inhibition – The ability of the compounds of Formula (1.0.0) to selectively inhibit PDE4 is demonstrated by the human PDE inhibition assay. In this assay all 20   isoenzyme preparations are derived from human sources. PDE3 and PDE4 preparations are obtained by taking advantage of the predominance of PDE3 isozymes in platelets and PDE4 isozymes in neutrophils. The following techniques are utilized. Citrated human blood is collected and neutrophils are separated by dextran sedimentation, density gradient centrifugation, and hypotonic lysis of erythrocytes. Human platelets from the same source 25   are washed with PBS (NaCl 140 mM, KCl 2.7 mM,  $\text{KH}_2\text{PO}_4$  1.5 mM,  $\text{Na}_2\text{HPO}_4$  8.1 mM, pH 7.4). Neutrophils and platelets are suspended in 10ml of buffer (0.24 M sucrose, 1 mM EDTA, 1mM dithiothreitol, 10mM tris HCl, pH 7.4) containing the following protease inhibitor solutions: 5  $\mu\text{l/ml}$  of phenylmethylsulphonylfluoride (7 mg/ml in 2-propanol), 1  $\mu\text{l/ml}$  leupeptin and pepstatin A (1 mg/ml each, in ethanol). After sonication for 15 sec at 4°C, homogenates 30   are centrifuged (2200g). The pellet is resuspended in 10ml of buffer and the sonication is repeated. Pooled supernatants are stored at -20°C.

Other isoenzymes are partially purified employing chromatographic methods as described in the art, with PDE1 and PDE5 being obtained from human lung, and PDE2 being obtained from human platelets. PDE activity is assayed in the presence and absence of a 35   test substance of Formula (1.0.0) at varying concentrations, using the ion-exchange column method described by Thompson *et al.*, *Nucleotide Res.*, 10 69-92, 1979; with 1 $\mu\text{M}$ [ $^3\text{H}$ ]-cyclic

AMP as substrate (PDE3 and PDE4), or 0.5  $\mu$ M calcium, 0.125  $\mu$ M calmodulin and 1.0  $\mu$ M [ $^3$ H]-cyclic AMP (PDE1), or 100  $\mu$ M [ $^3$ H]-cyclic AMP (PDE2), or 1.0  $\mu$ M [ $^3$ H]-cyclic GMP (PDE5).

In this test method, compounds of Formula (1.0.0) predominantly inhibit PDE4 isozymes, having relatively little inhibitory effect on PDE1, PDE2, PDE3, and PDE5.

5           The selective PDE4 inhibitory activity of the compounds of Formula (1.0.0) can also be determined using a battery of five distinct PDE isozymes in accordance with procedures known in the art. The tissues used as sources of the different isozymes can include the following: PDE1B - porcine aorta; PDE1C - guinea-pig heart; PDE3 - guinea-pig heart; PDE4 - human monocyte; and PDE5 - canine tracheole. PDEs 1B, 1C, 3, and 5 are partially purified  
10           using conventional chromatographic techniques; Torphy and Cieslinski, *Mol. Pharmacol.* 37 206-214, 1990. PDE4 is purified to kinetic homogeneity by the sequential use of anion-exchange followed by heparin-Sepharose chromatography; Torphy *et al.*, *J. Biol. Chem.* 267 1798-1804, 1992. PDE activity is assayed using the protocol of Torphy and Cieslinski described in the above-recited paper.

15           It is also possible to evaluate the ability of the PDE4 inhibitory compounds of Formula (1.0.0) to increase cAMP accumulation in intact tissues by using U-937 cells, a human monocyte cell line that has been shown to contain a large amount of PDE4. In order to assess the level of PDE4 inhibitory activity in intact cells, nondifferentiated U-937 cells (approximately  $10^5$  cells/reaction tube) are incubated with various concentrations (0.01-1000  
20            $\mu$ M) of PDE inhibitors for 1m and 1  $\mu$ M prostaglandin  $E_2$  for an additional 4m. The cells are lysed 5m after initiating the reaction by the addition of 17.5% perchloric acid, the pH is brought to a neutral level by the addition of 1M  $KCO_3$ , and cAMP content is assessed by RIA. A general protocol for this assay is described in Brooker *et al.*, "Radioimmunoassay of cyclic AMP and cyclic GMP," *Adv. Cyclic Nucleotide Res.* 10 1-33, 1979.

25           Bronchodilator Activity - Various isozyme-selective PDE inhibitors have been identified that cause effective relaxation of airway smooth muscle in human airways, while the presence of enzyme activity by PDEs 1, 2, 3, 4, and 5 have been identified in these tissues and cells. Selective inhibitors of PDE3 and PDE4 have been shown to cause relaxation of bronchial rings under various conditions. Further, cAMP is involved not only in smooth  
30           muscle relaxation, but also exerts an overall inhibitory influence on airway smooth muscle proliferation. Airway smooth muscle hypertrophy and hyperplasia can be modulated by cAMP, and these conditions are common morphological features of chronic asthma. The combination of a PDE3 and PDE4 inhibitor has been shown to have a marked inhibitory effect on proliferation. Several PDE isozyme families including PDE4 have been found in human  
35           pulmonary arteries and selective PDE inhibitors have been shown to exert relaxation of pulmonary artery rings.

Relaxation of Human Bronchus – Samples of human lungs dissected during surgery for cancer are obtained within 3 days after removal. Small bronchi (inner diameter  $\approx$  2 to 5 mm) are excised, cut into segments and placed in 2 ml liquid nitrogen storage ampoules filled with fetal calf serum (FCS) containing 1.8M dimethylsulfoxide (DMSO) and 0.1M sucrose as cryoprotecting agents. The ampoules are placed in a polystyrol box (11 x 11 x 22 cm) and slowly frozen at a mean cooling rate of about 0.6°C/m in a freezer maintained at -70°C. After 3-15h the ampoules are transferred into liquid nitrogen (-196°C) where they are stored until use. Before use the tissues are exposed for 30-60m to -70°C before being thawed within 2.5m by placing the ampoules in a 37°C water bath. Thereafter the bronchial segments are rinsed by placing them in a dish containing Krebs-Henseleit solution ( $\mu$ M: NaCl 118, KCl 4.7, MgSO<sub>4</sub> 1.2, CaCl<sub>2</sub> 1.2, KH<sub>2</sub>PO<sub>4</sub> 1.2, NaHCO<sub>3</sub> 25, glucose 11, EDTA 0.03) at 37°C, cut into rings and suspended in 10 ml organ baths for isometric tension recording under a preload of about 1g. Concentration-response curves are produced by cumulative additions, each concentration being added when the maximum effect has been produced by the previous concentration. Papaverine (300  $\mu$ M) is added at the end of the concentration response curve to induce complete relaxation of the bronchial rings. This effect is taken as 100% relaxation.

In the above test model compounds of Formula (1.0.0) produce concentration-related relaxation of human bronchus ring preparations at concentrations in the range of from 0.001 to 1.0  $\mu$ M with preferred embodiments being active at concentrations in the range of from 5.0 nM to 50 nM.

Suppression of Bombesin-induced Bronchoconstriction – Male Dunkin-Hartley guinea-pigs (400-800g) having free access to food and water prior to the experiment, are anaesthetized with sodium phenobarbital (100 mg/kg i.p.) and sodium pentobarbital (30 mg/kg i.p.), then paralyzed with gallamine (10 mg/kg i.m.). Animals, maintained at 37°C with a heated pad, controlled by a rectal thermometer, are ventilated via a tracheal cannula (about 8 ml/kg, 1 Hz) with a mixture of air and oxygen (45:55 v/v). Ventilation is monitored at the trachea by a pneumotachograph connected to a differential pressure transducer in line with the respiratory pump. Pressure changes within the thorax are monitored directly via an intrathoracic cannula, using a differential pressure transducer so that the pressure difference between the trachea and thorax can be measured and displayed. From these measurements of air-flow and transpulmonary pressure, both airway resistance ( $R$ , cmH<sub>2</sub>O/l/s) and compliance ( $Cd_{dyn}$ ) are calculated with a digital electronic respiratory analyzer for each respiratory cycle. Blood pressure and heart rate are recorded from the carotid artery using a pressure transducer.

When values for basal resistance and compliance are stable, sustained bronchoconstriction is induced by a continuous intravenous infusion of bombesin (100

ng/kg/min). Bombesin is dissolved in 100% ethanol and diluted with phosphate buffered saline. Test compounds of Formula (1.0.0) are administered when the response to bombesin is maximal and stable, which is calculated to be 2m after the start of bombesin infusion. Reversal of bronchoconstriction is assessed over 1h following either intratracheal or intraduodenal instillation or intravenous bolus injection. Bronchospasmolytic activity is expressed as a % inhibition of the initial, maximal resistance ( $R_0$ ) following the infusion of bombesin.  $ED_{50}$  values represent the dose which causes a 50% reduction of the increase in resistance induced by bombesin. Duration of action is defined as the time in minutes where bronchoconstriction is reduced by 50% or more. Effects on blood pressure (BP) and heart rate (HR) are characterized by  $ED_{20}$  values; i.e., the doses which reduce BP or HR by 20% measured 5m after administration.

Test compounds of Formula (1.0.0) are administered either as solutions or, in the case of intratracheal or intraduodenal instillation, also as aqueous suspensions containing 0.5 % tragacanth where a test compound is not sufficiently soluble. Suspensions are sonicated for 5m to achieve a small particle size prior to administration. Each drug is tested in 2 to 4 doses ( $n = 3-4$  per dose). An adequate number of controls (5-6) is used.

In the above test model, compounds of Formula (1.0.0) exhibit bronchodilator activity at dosages in the range of from 0.001 to 0.1 mg/kg *i.v.* or 0.1 to 5.0 mg/kg *i.d.*

Asthmatic Rat Assay - A test for evaluating the therapeutic impact of a compound of Formula (1.0.0) on the symptom of dyspnea, i.e., difficult or labored breathing, utilizes rats obtained from an inbred line of asthmatic rats. Both female (190-250 g) and male (260-400 g) rats are used.

The egg albumin (EA), grade V, crystallized and lyophilized, aluminum hydroxide, and methysergide bimeleate used in this test are commercially available. The challenge and subsequent respiratory readings are carried out in a clear plastic box with internal dimensions of 10x6x4 inches. The top of the box is removable. In use the top is held firmly in place by four clamps, and an airtight seal is maintained by a soft rubber gasket. Through the center of each end of the chamber a nebulizer is inserted *via* an airtight seal and each end of the box also has an outlet. A pneumotachograph is inserted into one end of the box and is coupled to a volumetric pressure transducer which is then connected to a dynograph through appropriate couplers. While aerosolizing the antigen, the outlets are open and the pneumotachograph is isolated from the chamber. The outlets are then closed and the pneumotachograph and the chamber are connected during the recording of the respiratory patterns. For challenge, 2 ml of a 3% solution of antigen in saline is placed in each nebulizer and the aerosol is generated with air from a small diaphragm pump operating at 10 psi and a flow rate of 8 l/m.

Rats are sensitized by injecting subcutaneously 1 ml of a suspension containing 1 mg EA and 200 mg aluminum hydroxide in saline. They are used between days 12 and 24 post-sensitization. In order to eliminate the serotonin component of the response, rats are pretreated intravenously 5m prior to aerosol challenge with 3.0 mg/kg of methysergide. Rats are then exposed to an aerosol of 3% EA in saline for exactly 1m, then respiratory profiles are recorded for a further 30m. The duration of continuous dyspnea is measured from the respiratory recordings.

Test compounds of Formula (1.0.0) are generally administered either orally 1-4h prior to challenge or intravenously 2m prior to challenge. The compounds are either dissolved in saline or 1% methocel, or suspended in 1% methocel. The volume of test compound injected is 1 ml/kg (intravenously) or 10 ml/kg (orally). Prior to oral treatment rats are starved overnight. The activity of the rats is determined on the basis of their ability to decrease the duration of symptoms of dyspnea in comparison to a group of vehicle-treated controls. A test compound of Formula (1.0.0) is evaluated over a series of doses and an ED<sub>50</sub> is derived that is defined as the dose (mg/kg) which will inhibit the duration of symptoms by 50%.

Pulmonary Mechanics in Trained, Conscious Squirrel Monkeys - The ability of the compounds of Formula (1.0.0) to inhibit *Ascaris* antigen induced changes in the respiratory parameters, e.g., airway resistance, of squirrel monkey test subjects is evaluated in this method. This test procedure involves placing trained squirrel monkeys in chairs in aerosol exposure chambers. For control purposes, pulmonary mechanics measurements of respiratory parameters are recorded for a period of about 30m to establish each monkey's normal control values for that day. For oral administration, compounds of Formula (1.0.0) are dissolved or suspended in a 1% methocel solution (methylcellulose, 65HG, 400 cps) and given in a volume of 1 ml/kg of body weight. For aerosol administration of compounds of Formula (1.0.0) an ultrasonic nebulizer is used. Pretreatment periods vary from 5m to 4h before the monkeys are challenged with aerosol doses of *Ascaris* antigen.

Following challenge, each minute of data is calculated as a percent change from control values for each respiratory parameter including airway resistance ( $R_L$ ) and dynamic compliance ( $C_{dyn}$ ). The results for each test compound are subsequently obtained for a minimum period of 60m post-challenge, which are then compared to previously obtained historical baseline control values for the particular monkey involved. Further, the overall values for 60m post-challenge for each monkey, i.e., historical baseline values and test values, are averaged separately and are used to calculate the overall percent inhibition of *Ascaris* antigen response by the test compound. For statistical analysis of the results, the paired t-test is used.

Prevention of Induced Bronchoconstriction in Allergic Sheep – A procedure for testing the therapeutic activity of the compounds of Formula (1.0.0) in preventing bronchoconstriction is described below. It is based on the discovery of a certain breed of allergic sheep with a known sensitivity to a specific antigen, *Ascaris suum*, that responds to inhalation challenge with acute as well as late bronchial responses. The progress of both the acute and the late bronchial responses over time approximates the time course observed in humans with asthma; moreover, the pharmacological modification of both the acute and late responses is similar to that found in man. The responses of these sheep to the antigen challenge is observed for the most part in their large airways, which makes it possible to monitor the effects as changes in lung resistance, i.e., specific lung resistance

Adult sheep with a mean weight of 35 kg (range: 18-50 kg) are used. All animals used meet two criteria: 1) they have a natural cutaneous reaction to 1:1000 or 1:10000 dilutions of *Ascaris suum* extract, and 2) they have previously responded to inhalation challenge with *Ascaris suum* with both an acute bronchoconstriction and a late bronchial obstruction. See Abraham *et al.*, *Am. Rev. Resp. Dis.* 128 839-844, 1983.

The unsedated sheep are restrained in a cart in the prone position with their heads immobilized. After topical anesthesia of the nasal passages with 2% lidocaine solution, a balloon catheter is advanced through one nostril into the lower esophagus. The animals are then intubated with a cuffed endotracheal tube through the other nostril using a flexible fiberoptic bronchoscope as a guide. Pleural pressure is estimated with the esophageal balloon catheter (filled with 1 ml of air), which is positioned such that inspiration produces a negative pressure deflection with clearly discernible cardiogenic oscillations. Lateral pressure in the trachea is measured with a sidehole catheter (inner dimensions: 2.5 mm) advanced through and positioned distal to the tip of the nasotracheal tube. Transpulmonary pressure, i.e., the difference between tracheal pressure and pleural pressure, is measured with a differential pressure transducer. Testing of the pressure transducer catheter system reveals no phase shift between pressure and flow to a frequency of 9 Hz. For the measurement of pulmonary resistance ( $R_L$ ), the maximal end of the nasotracheal tube is connected to a pneumotachograph. The signals of flow and transpulmonary pressure are recorded on an oscilloscope which is linked to a computer for on-line calculation of  $R_L$  from transpulmonary pressure, respiratory volume obtained by integration, and flow. Analysis of 10-15 breaths is used for the determination of  $R_L$ . Thoracic gas volume ( $V_{tg}$ ) is measured in a body plethysmograph, to obtain pulmonary resistance ( $SR_L = R_L \cdot V_{tg}$ ).

Aerosols of *Ascaris suum* extract (1:20) are generated using a disposable medical nebulizer which produces an aerosol with a mass median aerodynamic diameter of 6.2  $\mu\text{m}$  (geometric standard deviation, 2.1) as determined by an electric size analyzer. The output

from the nebulizer is directed into a plastic T-piece, one end of which is attached to the nasotracheal tube, and the other end of which is connected to the inspiratory part of a conventional respirator. The aerosol is delivered at a total volume of 500 ml at a rate of 20 ml per minute. Thus, each sheep receives an equivalent dose of antigen in both placebo and drug trials

Prior to antigen challenge, baseline measurements of  $SR_L$  are obtained, infusion of the test compound is started 1h prior to challenge, the measurement of  $SR_L$  is repeated, and the sheep then undergoes inhalation challenge with *Ascaris suum* antigen. Measurements of  $SR_L$  are obtained immediately after antigen challenge and at 1, 2, 3, 4, 5, 6, 6.5, 7, 7.5, and 8h after antigen challenge. Placebo and drug tests are separated by at least 14 days. In a further study, sheep are given a bolus dose of the test compound followed by an infusion of the test compound for 0.5-1h prior to *Ascaris* challenge and for 8h after *Ascaris* challenge as described above. A Kruskal-Wallis one way ANOVA test is used to compare the acute immediate responses to antigen and the peak late response in the controls and the drug treated animals.

Anti-inflammatory Activity – The anti-inflammatory activity of the compounds of Formula (1.0.0) is demonstrated by the inhibition of eosinophil activation. In this assay blood samples (50ml) are collected from non-atopic volunteers with eosinophil numbers ranging between  $0.06$  and  $0.47 \times 10^9 L^{-1}$ . Venous blood is collected into centrifuge tubes containing 5 ml trisodium citrate (3.8%, pH 7.4).

The anticoagulated blood is diluted (1:1, v:v) with phosphate-buffered saline (PBS, containing neither calcium nor magnesium) and is layered onto 15 ml isotonic Percoll (density 1.082 - 1.085 g/ml, pH 7.4), in a 50 ml centrifuge tube. Following centrifugation (30 minutes,  $1000 \times g$ ,  $20^\circ C$ ), mononuclear cells at the plasma/Percoll interface are aspirated carefully and discarded.

The neutrophil/eosinophil/erythrocyte pellet (ca. 5 ml by volume) is gently resuspended in 35 ml of isotonic ammonium chloride solution ( $NH_4Cl$ , 155mM;  $KHCO_3$ , 10mM; EDTA, 0.1mM;  $0-4^\circ C$ ). After 15 min, cells are washed twice (10 min,  $400 \times g$ ,  $4^\circ C$ ) in PBS containing fetal calf serum (2%, FCS).

A magnetic cell separation system is used to separate eosinophils and neutrophils. This system is able to separate cells in suspension according to surface markers, and comprises a permanent magnet, into which is placed a column that includes a magnetizable steel matrix. Prior to use, the column is equilibrated with PBS/FCS for 1 hour and then flushed with ice-cold PBS/FCS on a retrograde basis via a 20 ml syringe. A 21G hypodermic

needle is attached to the base of the column and 1-2 ml of ice cold buffer are allowed to efflux through the needle.

Following centrifugation of granulocytes, supernatant is aspirated and cells are gently resuspended with 100 $\mu$ l magnetic particles (anti-CD16 monoclonal antibody, conjugated to superparamagnetic particles). The eosinophil/neutrophil/anti-CD16 magnetic particle mixture is incubated on ice for 40 minutes and then diluted to 5 ml with ice-cold PBS/FCS. The cell suspension is slowly introduced into the top of the column and the tap is opened to allow the cells to move slowly into the steel matrix. The column is then washed with PBS/FCS (35ml), which is carefully added to the top of the column so as not to disturb the magnetically labeled neutrophils already trapped in the steel matrix. Non-labeled eosinophils are collected in a 50ml centrifuge tube and washed (10 minutes, 400 x g, 4°C). The resulting pellet is resuspended in 5 ml Hank's balanced salt solution (HBSS) so that cell numbers and purity can be assessed prior to use. The separation column is removed from the magnet and the neutrophil fraction is eluted. The column is then washed with PBS (50ml) and ethanol (absolute), and stored at 4°C.

Total cells are counted with a micro cell counter. One drop of lysogenic solution is added to the sample, which after 30s is recounted to assess contamination with erythrocytes. Cytospin smears are prepared on a Shandon Cytospin 2 cytospinner (100  $\mu$ l samples, 3 minutes, 500 rpm). These preparations are stained and differential cell counts are determined by light microscopy, examining at least 500 cells. Cell viability is assessed by exclusion of trypan blue.

Eosinophils are diluted in HBSS and pipetted into 96 well microtiter plates (MTP) at 1-10 x 10<sup>3</sup> cells/well. Each well contains a 200  $\mu$ l sample comprising: 100  $\mu$ l eosinophil suspension; 50  $\mu$ l HBSS; 10  $\mu$ l lucigenin; 20  $\mu$ l activation stimulus; and 20  $\mu$ l test compound.

The samples are incubated with test compound or vehicle for 10m prior to addition of an activation stimulus fMLP (10  $\mu$ M) dissolved in dimethylsulfoxide and thereafter diluted in buffer, such that the highest solvent concentration used is 1% (at 100  $\mu$ M test compound). MTPs are agitated to facilitate mixing of the cells and medium, and the MTP is placed into a luminometer. Total chemiluminescence and the temporal profile of each well is measured simultaneously over 20m and the results expressed as arbitrary units, or as a percentage of fMLP-induced chemiluminescence in the absence of test compound. Results are fitted to the Hill equation and IC<sub>50</sub> values are calculated automatically.

Compounds of Formula (1.0.0) are active in the above test method at concentrations in the range of from 0.0001 $\mu$ M to 20.0  $\mu$ M, with preferred embodiments being active at concentrations in the range of from 0.5 nM to 1000 nM.

From the above it may be seen that compounds of Formula (1.0.0) are useful for the treatment of inflammatory or obstructive airways diseases or other conditions involving airways obstruction. In particular they are useful for the treatment of bronchial asthma.

5 In view of their anti-inflammatory activity, their influence on airways hyper-reactivity, and their profile in relation to PDE isoenzyme inhibition, in particular as selective PDE4 inhibitors, the compounds of Formula (1.0.0) are useful for the treatment, in particular prophylactic treatment, of obstructive or inflammatory airways diseases. Thus, by continued and regular administration over prolonged periods of time the compounds of Formula (1.0.0) are useful in providing advance protection against the recurrence of bronchoconstriction or  
10 other symptomatic attack consequential to obstructive or inflammatory airways diseases. The compounds of Formula (1.0.0) are also useful for the control, amelioration or reversal of the basal status of such diseases.

Having regard to their bronchodilator activity the compounds of Formula (1.0.0) are useful as bronchodilators, e.g., in the treatment of chronic or acute bronchoconstriction, and  
15 for the symptomatic treatment of obstructive or inflammatory airways diseases.

The words "treatment" and "treating" as used throughout the present specification and claims in relation to obstructive or inflammatory airways diseases are to be understood, accordingly, as embracing both prophylactic and symptomatic modes of therapy.

In light of the above description, it may be seen that the present invention also relates  
20 to a method for the treatment of airways hyper-reactivity in mammals; to a method of effecting bronchodilation in mammals; and in particular, to a method of treating obstructive or inflammatory airways diseases, especially asthma, in a mammal subject in need thereof, which method comprises administering to said subject mammal an effective amount of a compound of Formula (1.0.0).

25 Obstructive or inflammatory airways diseases to which the present invention applies include asthma; pneumoconiosis; chronic eosinophilic pneumonia; chronic obstructive airways or pulmonary disease (COAD or COPD); and adult respiratory distress syndrome (ARDS), as well as exacerbation of airways hyper-reactivity consequent to other drug therapy, e.g., aspirin or  $\beta$ -agonist therapy.

30 The compounds of Formula (1.0.0) are useful in the treatment of asthma of whatever type, etiology, or pathogenesis; including intrinsic asthma attributed to pathophysiologic disturbances, extrinsic asthma caused by some factor in the environment, and essential asthma of unknown or inapparent cause. The compounds of Formula (1.0.0) are useful in the treatment of allergic (atopic/bronchial/IgE-mediated) asthma; and they are useful as well in  
35 the treatment of non-atopic asthma, including e.g. bronchitic, emphysematous, exercise-

induced, and occupational asthma; infective asthma that is a sequela to microbial, especially bacterial, fungal, protozoal, or viral infection; and other non-allergic asthmas, e.g., incipient asthma (wheezy infant syndrome).

The compounds of Formula (1.0.0) are further useful in the treatment of pneumoconiosis of whatever type, etiology, or pathogenesis; including, e.g., aluminosis (bauxite workers' disease); anthracosis (miners' asthma); asbestosis (steam-fitters' asthma); chalicosis (flint disease); ptilosis caused by inhaling the dust from ostrich feathers; siderosis caused by the inhalation of iron particles; silicosis (grinders' disease); byssinosis (cotton-dust asthma); and talc pneumoconiosis.

## 10 **8.2 Chronic Obstructive Pulmonary Disease (COPD)**

The compounds of Formula (1.0.0) are still further useful in the treatment of COPD or COAD including chronic bronchitis, pulmonary emphysema or dyspnea associated therewith. COPD is characterized by irreversible, progressive airways obstruction. Chronic bronchitis is associated with hyperplasia and hypertrophy of the mucus secreting glands of the submucosa in the large cartilaginous airways. Goblet cell hyperplasia, mucosal and submucosal inflammatory cell infiltration, edema, fibrosis, mucus plugs and increased smooth muscle are all found in the terminal and respiratory bronchioles. The small airways are known to be a major site of airway obstruction. Emphysema is characterized by destruction of the alveolar wall and loss of lung elasticity. A number of risk factors have also been identified as linked to the incidence of COPD. The link between tobacco smoking and COPD is well established. Other risk factors include exposure to coal dust and various genetic factors. See Sandford *et al.*, "Genetic risk factors for chronic obstructive pulmonary disease," *Eur. Respir. J.* **10** 1380-1391, 1997. The incidence of COPD is increasing and it represents a significant economic burden on the populations of the industrialized nations. COPD also presents itself clinically with a wide range of variation from simple chronic bronchitis without disability to patients in a severely disabled state with chronic respiratory failure.

COPD is characterized by inflammation of the airways, as is the case with asthma, but the inflammatory cells that have been found in the bronchoalveolar lavage fluid and sputum of patients neutrophils rather than eosinophils. Elevated levels of inflammatory mediators are also found in COPD patients, including IL-8, LTB<sub>4</sub>, and TNF- $\alpha$ , and the surface epithelium and sub-epithelium of the bronchi of such patients has been found to be infiltrated by T-lymphocytes and macrophages. Symptomatic relief for COPD patients can be provided by the use of  $\beta$ -agonist and anticholinergic bronchodilators, but the progress of the disease remains unaltered. COPD has been treated using theophylline, but without much success, even though it reduces neutrophil counts in the sputum of COPD patients. Steroids have also failed to hold out much promise as satisfactory treatment agents in COPD.

Accordingly, the use of the compounds of Formula (1.0.0) to treat COPD and its related and included obstructed airways diseases, represents a significant advance in the art. The present invention is not limited to any particular mode of action or any hypothesis as to the way in which the desired therapeutic objectives have been obtained by utilizing the compounds of Formula (1.0.0). However, it is recognized in the art that PDE4 is the predominant PDE in neutrophils and macrophages; Cheng *et al.*, "Synthesis and *in vitro* profile of a novel series of catechol benzimidazoles. The discovery of potent, selective phosphodiesterase Type IV inhibitors with greatly attenuated affinity for the [3H]rolipram binding site," *Bioorg. Med. Chem. Lett.* 5 1969-1972, 1995; Wright *et al.* "Differential inhibition of human neutrophil functions: role of cyclic AMP-specific, cyclic GMP-insensitive phosphodiesterase," *Biochem. Pharmacol.* 40 699-707, 1990; Schudt *et al.*, "Influence of selective phosphodiesterase inhibitors on human neutrophil functions and levels of cAMP and Cai," *Naunyn Schmiedebergs Arch. Pharmacol.* 344 682-690, 1991; and Tenor *et al.*, "Cyclic nucleotide phosphodiesterase isoenzyme activities in human alveolar macrophages," *Clin. Exp. Allergy* 25 625-633, 1995.

In order to provide a better understanding of the present invention, the inference is made here that the compounds of Formula (1.0.0) inhibit PDE4s in neutrophils, resulting in reduced chemotaxis, activation, adherence, and degranulation; Schudt *et al.*, *Ibid.*; Nelson *et al.*, "Effect of selective phosphodiesterase inhibitors on the polymorphonuclear leukocyte respiratory burst," *J. Allergy Clin. Immunol.* 86 801-808, 1990; and Bloeman *et al.*, "Increased cAMP levels in stimulated neutrophils inhibit their adhesion to human bronchial epithelial cells," *Am. J. Physiol.* 272 L580-587, 1997.

It is also inferred that the compounds of Formula (1.0.0) reduce superoxide anion production mediated by PDE4s in peripheral blood neutrophils, and that they regulate leukotriene synthesis mediated by PDE4s; Wright *et al.*, *Ibid.*; Schudt *et al.*, *Ibid.*; Bloeman *et al.*, *Ibid.*; Al Essa, *et al.*, "Heterogeneity of circulating and exudated polymorphonuclear leukocytes in superoxide-generating response to cyclic AMP and cyclic AMP-elevating agents: investigation of the underlying mechanism," *Biochem. Pharmacol.* 49 315-322, 1995; Ottonello *et al.*, "Cyclic AMP-elevating agents down-regulate the oxidative burst induced by granulocyte-macrophage colony stimulating factor (GM-CSF) in adherent neutrophils," *Clin. Exp. Immunol.* 101 502-506, 1995; and Ottonello *et al.*, "Tumor necrosis factor alpha-induced oxidative burst in neutrophils adherent to fibronectin: effects of cyclic AMP-elevating agents," *Br. J. Haematol.* 91 566-570, 1995.

It is further inferred that the compounds of Formula (1.0.0) inhibit CD11b/CD18 expression; Berends *et al.*, "Inhibition of PAF-induced expression of CD11b and shedding of L-selectin on human neutrophils and eosinophils by the type-IV selective PDE inhibitor,

rolipram," *Eur. Respir. J.* 10 1000-1007, 1997; and Derian *et al.*, "Inhibition of chemotactic peptide-induced neutrophil adhesion to vascular endothelium by cAMP modulators," *J. Immunol.* 154 308-317, 1995.

It is still further inferred that the compounds of Formula (1.0.0) inhibit alveolar macrophage PDE4s, thereby reducing the release of chemotactic factors and TNF- $\alpha$ ; and that the compounds of Formula (1.0.0) increase synthesis and facilitate release from monocytes of the anti-inflammatory cytokine IL-10, which in turn is capable of decreasing the generation of TNF- $\alpha$ , IL-1 $\beta$ , and GM-CSF by synovial fluid mononuclear cells, thereby augmenting the overall anti-inflammatory profile of the PDE4 inhibitors of Formula (1.0.0); Schudt *et al.*, "PDE isoenzymes as targets for anti-asthma drugs," *Eur. Respir. J.* 8 1179-1183, 1995; and Kambayashi *et al.*, "Cyclic nucleotide phosphodiesterase Type IV participates in the regulation of IL-10 and the subsequent inhibition of TNF-alpha and IL-6 release by endotoxin-stimulated macrophages," *J. Immunol.* 155 4909-4916, 1995.

The application of PDE4 inhibitors to the treatment of COPD in human patients has been demonstrated in clinical trials. Treatment with SB-207,499, also known as ariflo, and represented by Formula (0.1.9) above as well as below, at a dose of 15 mg twice a day for six weeks has been shown to result in increases in FEV<sub>1</sub> and forced vital capacity (FVC); Brown, W.M., "SB-207499," *Anti-inflamm. Immunomodulatory Invest. Drugs* 1 39-47, 1999. The clinical efficacy of SB-207,499 has also been demonstrated in a four week trial that has provided evidence of improved FEV<sub>1</sub>; and in a six week study in COPD patients receiving 15 mg twice a day that has also provided evidence of improved FEV<sub>1</sub>; Brown, *Ibid.* SB-207,499, or ariflo, has already been described further above and may be represented by Formula (0.1.9):

SB-207,499

(0.1.9)

### 8.3 Bronchitis and Bronchiectasis

In accordance with the particular and diverse inhibitory activities described above that are possessed by the compounds of Formula (1.0.0), they are useful in the treatment of bronchitis of whatever type, etiology, or pathogenesis, including, e.g., acute bronchitis which has a short but severe course and is caused by exposure to cold, breathing of irritant

substances, or an acute infection; acute laryngotracheal bronchitis which is a form of nondiphtheritic croup; arachidic bronchitis which is caused by the presence of a peanut kernel in a bronchus; catarrhal bronchitis which is a form of acute bronchitis with a profuse mucopurulent discharge; chronic bronchitis which is a long-continued form of bronchitis with a more or less marked tendency to recurrence after stages of quiescence, due to repeated attacks of acute bronchitis or chronic general diseases, characterized by attacks of coughing, by expectoration either scanty or profuse, and by secondary changes in the lung tissue; croupus bronchitis which is characterized by violent cough and paroxysms of dyspnea; dry bronchitis which is characterized by a scanty secretion of tough sputum; infectious asthmatic bronchitis which is a syndrome marked by the development of symptoms of bronchospasm following respiratory tract infections in persons with asthma; productive bronchitis which is bronchitis associated with a productive cough; staphylococcus or streptococcal bronchitis which are caused by staphylococci or streptococci; and vesicular bronchitis in which the inflammation extends into the alveoli, which are sometimes visible under the pleura as whitish-yellow granulations like millet seeds.

Bronchiectasis is a chronic dilatation of the bronchi marked by fetid breath and paroxysmal coughing with the expectoration of mucopurulent matter. It may affect the tube uniformly, in which case it is referred to as cylindric bronchiectasis, or it may occur in irregular pockets, in which case it is called sacculated bronchiectasis. When the dilated bronchial tubes have terminal bulbous enlargements, the term fusiform bronchiectasis is used. In those cases where the condition of dilatation extends to the bronchioles, it is referred to as capillary bronchiectasis. If the dilatation of the bronchi is spherical in shape, the condition is referred to as cystic bronchiectasis. Dry bronchiectasis occurs where the infection involved is episodic and it may be accompanied by hemoptysis, the expectoration of blood or of blood-stained sputum. During quiescent periods of dry bronchiectasis, the coughing which occurs is nonproductive. Follicular bronchiectasis is a type of bronchiectasis in which the lymphoid tissue in the affected regions becomes greatly enlarged, and by projection into the bronchial lumen, may seriously distort and partially obstruct the bronchus. Accordingly, the compounds of Formula (1.0.0) are useful in the beneficial treatment of the various above-described types of bronchiectasis as a direct result of their inhibition of PDE4 isozymes.

The utility of the compounds of Formula (1.0.0) as bronchodilators or bronchospasmolytic agents for treating bronchial asthma, chronic bronchitis and related diseases and disorder described herein, is demonstrable through the use of a number of different *in vivo* animal models known in the art, including those described in the paragraphs below..

Bronchospasmolytic Activity *In Vitro* — The ability of the compounds of Formula (1.0.0) to cause relaxation of guinea-pig tracheal smooth muscle is demonstrated in the following test procedure. Guinea-pigs (350-500 g) are killed with sodium pentothal (100 mg/kg i.p.). The trachea is dissected and a section 2-3 cm in length is excised. The trachea is transected in the transverse plane at alternate cartilage plates so as to give rings of tissue 3-5 mm in depth. The proximal and distal rings are discarded. Individual rings are mounted vertically on stainless steel supports, one of which is fixed at the base of an organ bath, while the other is attached to an isometric transducer. The rings are bathed in Krebs solution (composition  $\mu\text{M}$ :  $\text{NaHCO}_3$  25;  $\text{NaCl}$  113;  $\text{KCl}$  4.7;  $\text{MgSO}_4 \cdot 7\text{H}_2\text{O}$  1.2;  $\text{KH}_2\text{PO}_4$  1.2;  $\text{CaCl}_2$  2.5; glucose 11.7) at  $37^\circ\text{C}$  and gassed with  $\text{O}_2/\text{CO}_2$  (95:5, v/v). Rings prepared in this manner, preloaded to 1 g, generate spontaneous tone and, after a period of equilibration (45-60m), relax consistently on addition of spasmolytic drugs. To ascertain spasmolytic activity, test compounds of Formula (1.0.0) are dissolved in physiological saline and added in increasing quantities to the organ bath at 5m intervals to provide a cumulative concentration-effect curve.

In the above test model, compounds of Formula (1.0.0) produce concentration-related relaxation of guinea-pig tracheal ring preparations at concentrations in the range of from 0.001 to 1.0  $\mu\text{M}$ .

Suppression of Airways Hyper-reactivity in PAF-treated Animals — guinea-pigs are anesthetized and prepared for recording of lung function as described under "Suppression of bombesin-induced bronchoconstriction" further above. Intravenous injection of low dose histamine (1.0-1.8  $\mu\text{g/kg}$ ) establishes airways sensitivity to spasmogens. Following infusion of PAF (platelet activating factor) over 1h (total dose = 600 ng/kg), injection of low dose bombesin 20m after cessation of infusion reveals development of airways hyper-reactivity, which is expressed as the paired difference between the maximal response amplitude before and after PAF exposure. Upon administration of compounds of Formula (1.0.0) by infusion during PAF exposure, at dosages in the range of from 0.01 to 0.1 mg/kg, suppression of PAF- and bombesin-induced airways hyper-reactivity is obtained.

#### 8.4 Allergic and Other Types of Rhinitis; Sinusitis

Allergic rhinitis is characterized by nasal obstruction, itching, watery rhinorrhea, sneezing and occasional anosmia. Allergic rhinitis is divided into two disease categories, seasonal and perennial, in which the former is attributed to pollen or outdoor mould spores, while the latter is attributed to common allergens such as house dust mites, animal danders, and mould spores. Allergic rhinitis generally exhibits an early phase response and a late phase response. The early phase response is associated with mast cell degranulation, while the late phase response is characterized by infiltration of eosinophils, basophils, monocytes, and T-lymphocytes. A variety of inflammatory mediators is also released by these cells, all of which may contribute to the inflammation exhibited in the late phase response.

A particularly prevalent form of seasonal allergic rhinitis is hay fever, which is marked by acute conjunctivitis with lacrimation and itching, swelling of the nasal mucosa, nasal catarrh, sudden attacks of sneezing, and often with asthmatic symptoms. The compounds of Formula (1.0.0) are especially useful in the beneficial treatment of hay fever.

5 Other types of rhinitis for which the compounds of Formula (1.0.0) may be used as therapeutic agents include acute catarrhal rhinitis which is a cold in the head involving acute congestion of the mucous membrane of the nose, marked by dryness and followed by increased mucous secretion from the membrane, impeded respiration through the nose, and some pain; atrophic rhinitis which is a chronic form marked by wasting of the mucous  
10 membrane and the glands; purulent rhinitis which is chronic rhinitis with the formation of pus; and vasomotor rhinitis which is a non-allergic rhinitis in which transient changes in vascular tone and permeability with the same symptoms as allergic rhinitis, are brought on by such stimuli as mild chilling, fatigue, anger, and anxiety.

There is a recognized link between allergic rhinitis and asthma. Allergic rhinitis is a  
15 frequent accompaniment to asthma, and it has been demonstrated that treating allergic rhinitis will improve asthma. Epidemiologic data has also been used to show a link between severe rhinitis and more severe asthma. For example, the compound D-22888, under preclinical development for the treatment of allergic rhinitis, has been shown to exhibit a strong anti-allergic affect and to inhibit rhinorrhea in the antigen-challenged pig. See, Marx *et*  
20 30 *al* "D-22888 - a new PDE4 inhibitor for the treatment of allergic rhinitis and other allergic disorders," *J. Allergy Clin. Immunol.* 99 S444, 1997. Another experimental compound, AWD-12,281 has been shown to be active in a rat model of allergic rhinitis. See Poppe *et al* "Effect of AWD 12-281, a new selective PDE-4 inhibitor, loteprednol and beclomethasone in models of allergic rhinitis and airway inflammation in brown norway-rats," *Am. J. Respir. Crit. Care*  
25 *Med.* A95, 1999. The compounds D-22888 and AWD-12,281 have already been described further above and represented by Formulas (0.0.28) and (0.0.34), respectively:

D-22888  
(0.0.28)

Loteprednol (AWD - 12,281)

(0.0.34)

Sinusitis is related to rhinitis in terms of anatomical proximity as well as a shared  
30 etiology and pathogenesis in some cases. Sinusitis is the inflammation of a sinus and this

condition may be purulent or nonpurulent, as well as acute or chronic. Depending upon the sinus where the inflammation is located, the condition is known as ethmoid, frontal, maxillary, or sphenoid sinusitis. The ethmoidal sinus is one type of paranasal sinus, located in the ethmoid bone. The frontal sinus is one of the paired paranasal sinuses located in the frontal bone. The maxillary sinus is one of the paired paranasal sinuses located in the body of the maxilla. Accordingly, the compounds of Formula (1.0.0) are useful in the beneficial treatment of acute or chronic sinusitis, but especially of chronic sinusitis.

#### **8.5 Rheumatoid Arthritis, Osteoarthritis, Pain, Fever, and Gout**

Arthritis is defined as inflammation of the joints, and rheumatoid arthritis is a chronic systemic disease primarily of the joints, usually polyarticular, marked by inflammatory changes in the synovial membranes and articular structures, and by muscular atrophy and rarefaction of the bones. Late stages of rheumatoid arthritis are marked by ankylosis and deformity. Rheumatoid arthritis is a crippling autoimmune disease of unknown etiology which affects over 1% of the population.

As used herein, the term "rheumatoid arthritis" is intended to include within its scope where applicable related and associated forms of arthritis well known in the art, since these may also be treated with the compounds of Formula (1.0.0). Accordingly, the term "rheumatoid arthritis" includes acute arthritis, which is arthritis marked by pain, heat, redness, and swelling due to inflammation, infection, or trauma; acute gouty arthritis, which is acute arthritis associated with gout; chronic inflammatory arthritis, which is inflammation of the joints in chronic disorders such as rheumatoid arthritis; degenerative arthritis, which is osteoarthritis; infectious arthritis, which is arthritis caused by bacteria, rickettsiae, mycoplasmas, viruses, fungi, or parasites; Lyme arthritis, which is arthritis of the large joints associated with Lyme disease; proliferative arthritis, which is inflammation of the joints with proliferation of the synovium, seen in rheumatoid arthritis; psoriatic arthritis, which is a syndrome in which psoriasis occurs in association with inflammatory arthritis; and vertebral arthritis, which is inflammation involving the intervertebral disks.

The three major pathological features of rheumatoid arthritis that are responsible for progressive joint destruction are inflammation, abnormal cellular and humoral responses, and synovial hyperplasia. The particular cellular pathology of rheumatoid arthritis includes the presence of T-cells and monocytes. The T-cells, which are predominantly memory T-cells, constitute up to 50% of the cells recovered from the synovial tissue of rheumatoid arthritis patients; and of the monocytes found in the same tissue, 30-50% are antigen presenting cells, which is indicative of the autoimmune character of the disease. Pro-inflammatory cytokines, e.g., IL-1, IL-4, IL-5, IL-6, IL-9, IL-13, and TNF- $\alpha$ , are the major contributors to joint tissue damage, inflammation, hyperplasia, pannus formation and bone resorption. See Firestein, G.S. and Zvaifler, W.J., "How important are T-cells in chronic rheumatoid

synovitis?" *Arth. Rheum.* 33 768-773, 1990. This has been demonstrated, e.g., by the fact that monoclonal antibodies (Mabs) to TNF- $\alpha$  have shown promise in RA clinical trials; Maini *et al*, "Beneficial effects of tumor necrosis factor-alpha (TNF- $\alpha$  blockade in rheumatoid arthritis (RA)," *Clin. Exp. Immunol.* 101 207-212, 1995.

5           The PDE4 inhibitors of Formula (1.0.0) are useful in the treatment of rheumatoid arthritis as a result of their ability to suppress the activity of a variety of inflammatory cells, including basophils, eosinophils, and mast cells. These inhibitory activities of the compounds of Formula (1.0.0) have already been described further above, as has their wide range of *in vitro* anti-inflammatory action via the release of reactive oxygen species, prostaglandins, and  
10 inflammatory cytokines, e.g., IL-5, IFN- $\gamma$ , and TNF- $\alpha$ . See further Cohan *et al*, "In vitro pharmacology of the novel phosphodiesterase Type IV inhibitor, CP-80,633," *J. Pharm. Exp. Ther.* 278 1356-1361, 1996; and Barnette *et al*, "SB207499 (ARIFLO), a potent and selective second generation phosphodiesterase 4 inhibitor: *in vitro* anti-inflammatory actions," *J. Pharm. Exp. Ther.* 284 420-426, 1998. The PDE4 inhibitors of Formula (1.0.0) are also useful  
15 in the treatment of rheumatoid arthritis as a result of their effectiveness in inhibiting T-cell proliferation mediated via a number of different agents, including antigens such as house dust mite, which has been demonstrated in the art; Barnette *et al*, *Ibid*. The ability of the compounds of Formula (1.0.0) to facilitate the release of cytokine IL-10 from monocytes, which in turn is capable of decreasing the generation of TNF- $\alpha$ , IL-1, IL-4, IL-5, IL-6, IL-9, IL-  
20 13, and GM-CSF by synovial fluid mononuclear cells, further augments the overall anti-inflammatory profile of the PDE4 inhibitors of Formula(1.0.0); Kambayashi *et al*, *Ibid*. Further, the ability of the compounds of Formula (1.0.0) to inhibit TNF- $\alpha$  release from stimulated monocytes can be correlated with animal models of inflammation in which anti-inflammatory effects can be shown to correspond to suppression of TNF- $\alpha$  accumulation. One such animal  
25 model involves inhibition of LPS induced TNF- $\alpha$  release in mice by oral administration of a PDE4 inhibitor; Cheng *et al*, "The phosphodiesterase Type 4 (PDE4) inhibitor CP-80,633 elevates cyclic AMP levels and decreases TNF- $\alpha$  production in mice: effect of adrenalectomy," *J. Pharm. Exp. Ther.* 280 621-626, 1997. Another such animal model involves the inhibition of rat paw edema, induced by carageenan, by oral administration of rolipram; Singh *et al*, "Synovial fluid levels of tumor necrosis factor a in the inflamed rat knee: Modulation by dexamethasone and inhibitors of matrix metalloproteinases and  
30 phosphodiesterases," *Inflamm. Res.* 46(Suppl. 2) S153-S154, 1997.

Animal models of rheumatoid arthritis have also been used in the art for the purpose of demonstrating the correlation between *in vivo* modulation of TNF- $\alpha$  by PDE4 inhibitors and  
35 their utility in the treatment of rheumatoid arthritis. The activity of rolipram in animal models of acute inflammation such as the mouse adjuvant arthritis model, has been demonstrated in the

art; Sekut *et al*, "Anti-inflammatory activity of phosphodiesterase (PDE) IV inhibitors in acute and chronic models of inflammation," *Olin. Exp. Immunol.* 100(1) 126-132, 1995. The ability of rolipram to reduce disease severity in the collagen II induced arthritis (CIA) model after sc. or ip. injection has been demonstrated in the art; Nyman *et al*, "Amelioration of collagen II induced arthritis in rats by Type IV phosphodiesterase inhibitor rolipram," *Olin. Exp. Immunol.* 108 415-419, 1997. In this study the dosing regimen for rolipram was 2 mg/kg twice daily for five days before the onset of arthritis, and it significantly delayed the appearance of arthritic symptoms. After the cessation of treatment the test animals developed arthritis and reached the same arthritis top score as the control group. In the same study rolipram was also administered at 3 mg/kg twice daily at the time point when arthritis was apparent. This treatment drastically changed the development of the disease whereby progression of severity was halted and even after the cessation of treatment, the arthritis score did not reach the levels observed in untreated animals. The investigators were also able to demonstrate a strong down-regulation of TNF- $\alpha$  and IFN7 mRNA expression in regional lymph nodes, which suggests that the major effect of rolipram is exerted in the effector phase of the inflammatory process. Nyman *et al*, *Ibid*.

Inhibition of TNF- $\alpha$  Production by Human Monocytes *In Vitro* - The inhibitory effect of the compounds of Formula (1.0.0) on *in vitro* TNF- $\alpha$  production by human monocytes may be determined in accordance with the protocol described in EP 411 754 (Badger *et al*) and WO 90/15534 (Hanna). The referenced publications also describe two models of endotoxic shock which may be used to determine *in vivo* inhibitory activity of the compounds of Formula (1.0.0). The protocols used in these models are detailed and test compounds demonstrate a positive result by reducing serum levels of TNF- $\alpha$  induced by the injection of endotoxin.

Selective PDE4 inhibitors such as RP73401 have been shown to exhibit significant amelioration of disease, especially improvements in joint destruction, synovitis, and fibrosis, in animal models such as those involving streptococcal cell wall (SCW)-induced arthritis; Souness *et al*, "Potential of phosphodiesterase Type IV inhibitors in the treatment of rheumatoid arthritis," *Drugs* 1 541-553, 1998.

Of particular interest to the treatment of rheumatoid arthritis is the observation that PDE4 inhibitors have positive effects at the site of action of the disease. For example, RP73401 has been demonstrated to decrease TNF- $\alpha$  mRNA expression at the pannus/cartilage interface of paw joints of collagen II treated mice. Souness *et al*, *Ibid*. RP73401 has also been studied clinically in rheumatoid arthritis patients in a placebo-controlled, double-blind Phase II study of 35 rheumatoid arthritis patients administered 400 pg of the compound t.i.d. The compound was able to induce a positive trend towards clinical improvement associated with a reduction in C-reactive protein and IL-6 serum levels.

Chikanza *et al*, "The clinical effects of RP73401 phosphodiesterase Type 4 inhibitor in patients with rheumatoid arthritis," *Br. J. Rheumatol* 36:Abstr. Suppl. I, 186, 1997.

Assaying Increased cAMP Accumulation in Intact Tissues Using U-937 cells -  
Another assay suitable for demonstrating the PDE4 inhibiting activity of the compounds of  
Formula (1.0.0) is one which utilizes U-937 cells from a human monocyte cell line that has  
5 been shown to contain a large amount of PDE4. In order to assess the inhibition of PDE4  
activity in intact cells, non-differentiated U-937 cells at a density of approximately  $10^5$  cells per  
reaction tube are incubated with concentrations ranging from 0.01 to 1000 pM of test  
compound for one minute, and with 1  $\mu$ M of prostaglandin E2 for an additional four minutes.  
10 Five minutes after initiating the reaction, cells are lysed by the addition of 17.5% perchloric  
acid, after which the pH is brought to neutral by the addition of 1 M potassium carbonate. The  
cAMP content of the reaction tube is measured using RIA techniques. A detailed protocol for  
carrying out this assay is described in Brooker *et al*, "Radioimmunoassay of cyclic AMP and  
cyclic GMP," *Adv. Cyclic Nucleotide Res.* 10 1-33, 1979.

15 Gout refers to a group of disorders of purine metabolism, and fully developed gout is  
manifested by various combinations of hyperuricemia, recurrent, characteristic acute  
inflammatory arthritis induced by crystals of monosodium urate monohydrate, tophaceous  
deposits of said crystals in and around the joints of the extremities, which may lead to joint  
destruction and severe crippling, and uric acid urolithiasis. Rheumatic gout is another name  
20 for rheumatoid arthritis. Tophaceous gout is gout in which there are tophi or chalky deposits  
of sodium urate. Some therapeutic agents are useful in treating both gout and its attendant  
inflammation, e.g., phenylbutazone and colchicine; while other therapeutic agents possess  
only uricosuric properties, e.g., sulfinpyrazone and benzbromarone

Fever, or pyrexia, may be the result of any one of a large number of different factors,  
25 but with regard to the present invention such fever is either that manifested in  
pharyngoconjunctival fever or rheumatic fever, or that manifested during inflammation. A  
concomitant of inflammation is pain, especially that experienced in the joints and connective  
tissue of those suffering from rheumatoid arthritis and gout.

Accordingly, the PDE4 inhibitory compounds of Formula (1.0.0) provide beneficial  
30 results in the treatment of gout, and fever and pain associated with inflammation.

#### 8.6 Eosinophil-Related Disorders

The ability of the PDE4 inhibitory compounds of Formula (1.0.0) to inhibit eosinophil  
activation as part of their overall anti-inflammatory activity has been described above.  
Accordingly, the compounds of Formula (1.0.0) are useful in the therapeutic treatment of  
35 eosinophil-related disorders. Such disorders include eosinophilia, which is the formation and

accumulation of an abnormally large number of eosinophils in the blood. The name of the disorder derives from "eosin", a rose-colored stain or dye comprising a bromine derivative of fluorescein which readily stains "eosinophilic leukocytes" in the blood of patients who are thus readily identified. A particular eosinophilic disorder that can be treated in accordance with the present invention is pulmonary infiltration eosinophilia, which is characterized by the infiltration of the pulmonary parenchyma by eosinophils. This disorder includes especially Löffler's syndrome, which is a condition characterized by transient infiltrations of the lungs, accompanied by cough, fever, dyspnea, and eosinophilia.

Other eosinophilic disorders include chronic eosinophilic pneumonia, which is a chronic interstitial lung disease characterized by cough, dyspnea, malaise, fever, night sweats, weight loss, eosinophilia, and a chest film revealing non-segmental, non-migratory infiltrates in the lung periphery; tropical pulmonary eosinophilia, which is a subacute or chronic form of occult filariasis, usually involving *Brugia malayi*, *Wuchereria bancrofti*, or filariae that infect animals, occurs in the tropics, and is characterized by episodic nocturnal wheezing and coughing, strikingly elevated eosinophilia, and diffuse reticulonodular infiltrations of the lungs; bronchopneumonic aspergillosis, which is an infection of the bronchi and lungs by *Aspergillus* fungi resulting in a diseased condition marked by inflammatory granulomatous lesions in the nasal sinuses and lungs, but also in the skin, ear, orbit, and sometimes in the bones and meninges, and leading to aspergilloma, the most common type of fungus ball formed by colonization of *Aspergillus* in a bronchus or lung cavity.

The term "granulomatous" means containing granulomas, and the term "granuloma" refers to any small nodular delimited aggregation of mononuclear inflammatory cells or such a collection of modified macrophages resembling epithelial cells, usually surrounded by a rim of lymphocytes, with fibrosis commonly seen around the lesion. Some granulomas contain eosinophils. Granuloma formation represents a chronic inflammatory response initiated by various infectious and noninfectious agents. A number of such granulomatous conditions are treatable using a compound of Formula (1.0.0), e.g., allergic granulomatous angiitis, also called Churg-Strauss syndrome, which is a form of systemic necrotizing vasculitis in which there is prominent lung involvement, generally manifested by eosinophilia, granulomatous reactions, and usually severe asthma. A related disorder is polyarteritis nodosa (PAN), which is marked by multiple inflammatory and destructive arterial lesions and is a form of systemic necrotizing vasculitis involving the small and medium-sized arteries with signs and symptoms resulting from infarction and scarring of the affected organ system, in particular the lungs. Other eosinophil-related disorders which may be treated in accordance with the present invention are those affecting the airways which are induced or occasioned by a reaction to a therapeutic agent unrelated to any compound of Formula (1.0.0).

### 8.7 Atopic Dermatitis, Urticaria, Conjunctivitis, and Uveitis

Atopic dermatitis is a chronic inflammatory skin disorder seen in individuals with a hereditary predisposition to a lowered cutaneous threshold to pruritis, that is often accompanied by allergic rhinitis, hay fever, and asthma, and that is principally characterized by extreme itching. Atopic dermatitis is also called allergic dermatitis, and allergic or atopic eczema.

Atopic dermatitis (AD) is the most common chronic inflammatory skin disease in young children, and it affects from 10% to 15% of the population during childhood. Atopic dermatitis is frequently associated with asthma and allergies and it has therefore become known as a component of the so-called "atopic triad", since it occurs frequently in individuals with asthma and/or allergic rhinitis. See Leung Dym, *Atopic Dermatitis: From Pathogenesis To Treatment*, R.G. Landes Co., Austin, Texas, 1-226, 1996. Accordingly, the immune dysfunction associated with atopic dermatitis is treatable with therapeutic agents that are inhibitors of PDE4. For example, rolipram, Ro-201724, and denbufylline have been reported to produce a concentration-related inhibition of the proliferation of human peripheral blood mononuclear cells (HPBM) from normal patients as well as from subjects with atopic dermatitis. See, respectively, Torphy *et al.*, *Drugs and the Lung*, Eds. Page and Metzger, Raven Press, New York, 1994; and O'Brien, *Mol. Medicine Today*, 369, 1997. These studies also determined that the proliferative response of HPBM from atopic dermatitis patients was more sensitive to PDE4 inhibition than was the proliferation observed in HPBM from normal subjects.

Th2 type cytokine secreting T-cells expressing the cutaneous lymphocyte associated antigen play a central role in the induction of local IgE responses and the recruitment of eosinophils in this disease. The chronic inflammation seen in atopic dermatitis is considered to be the result of several interdependent factors, such as repeated or persistent allergen exposure, which can lead to Th2 cell expansion. It has been demonstrated that there is an increased frequency of allergen specific T-cells producing increased IL-4, IL-5, and IL-3 levels in the blood of atopic dermatitis patients. See Leung Dym *et al.*, "Allergic and immunological skin disorders," *JAMA* 278(22): 1914-1923, 1997. This is significant because IL-4 and IL-3 induce the expression of vascular adhesion molecule-1 (VCAM-1), an adhesion molecule involved in the migration of mononuclear cells and eosinophils into sites of tissue inflammation. Further, IL-5 is a key mediator of eosinophil activation, which is a common feature of atopic disease.

Increased concentration of cAMP in lymphocytes and basophils has long been known to be associated with decreased mediator release from those cells, and more recently it has been reported that histamine acting on H2 receptors increases cAMP levels and inhibits IL-4

production in murine Th2 cells. It is surmised, accordingly, that there is present in atopic diseases such as atopic dermatitis, impaired  $\beta$ -adrenergic responses or enhanced PDE4 activity of leukocyte inflammatory responses. A diminished cAMP response may result from an enhanced PDE4 activity that has a genetic basis or that is an acquired condition.

5        Studies have been carried out which compare different cell types from atopic patients with those from healthy volunteers, and the results have shown that increased cAMP-PDE activity in atopic cells correlates with abnormal inflammatory and immune cell function in atopic dermatitis. Further, the PDE4 enzyme from atopic leukocytes is more sensitive to PDE4 inhibitors than the PDE4 enzyme from normal leukocytes, and up to a 14-fold  
10       difference has been demonstrated. See Chan and Hanifin, "Differential inhibitory effects of cAMP phosphodiesterase isoforms in atopic and normal leukocytes," *J. Lab. Clin. Med.*, 121(1) 44-51, 1993. An increased sensitivity can also be seen in the inhibition of proliferation of peripheral blood mononuclear cells from atopic donors on treatment with PDE4 inhibitors. For example, rolipram has been found to be more effective at inhibiting PHA stimulated atopic  
15       dermatitis PBMC proliferation than at inhibiting PHA stimulated normal PBMC proliferation, with an  $IC_{50}$  = 280 nM compared to an  $IC_{50}$  = 2600 nM, respectively.

      Further, it has been shown that a structurally diverse range of selective PDE4 inhibitors are effective in reducing skin eosinophilia in the guinea pig which has been mediated via a range of agents such as PAF, arachidonic acid, zymosan activated plasma,  
20       and protein of cutaneous anaphylaxis. See Beasley *et al.*, "Synthesis and evaluation of a novel series of phosphodiesterase 4 inhibitors. A potential treatment for asthma," *Bioorg. Med. Chem. Letts.* 8 2629-2634, 1998. Such data shows the utility of PDE4 inhibitors in treating eosinophil driven skin diseases. Such treatment is by means of topical administration, e.g., topical atizoram applied bilaterally over eight days to twenty patients in a  
25       clinical trial has been found to effectively inhibit all of the inflammatory parameters tested, showing both qualitative and quantitative improvements with no adverse effects. See Hanifin *et al.*, "Type 4 phosphodiesterase inhibitors have clinical and *in vitro* anti-inflammatory effects in atopic dermatitis," *J. Invest. Dermatol.* 107 51-56, 1996.

      Accordingly, the PDE4 inhibitors of Formula (1.0.0) are useful for the beneficial  
30       treatment of atopic dermatitis as described above. A related area of therapeutic application for which the compounds of Formula (1.0.0) also produce beneficial results is in the treatment of urticaria. Urticaria is a vascular reaction, usually transient, involving the upper dermis, representing localized edema caused by dilatation and increased permeability of the capillaries, and marked by the development of wheals or hives. Many different stimuli are  
35       capable of inducing an urticarial reaction, and it may be classified according to precipitating causes, as: immune-mediated, complement-mediated which may involve immunologic or

nonimmunologic mechanisms, urticariogenic material-induced, physical agent-induced, stress-induced, or idiopathic. The condition may also be designated acute or chronic depending on the duration of an attack. Angioedema is the same response in the deep dermis or subcutaneous or submucosal tissues.

5           The most common types of urticaria which are treatable with the compounds of Formula (1.0.0) are cholinergic urticaria which is characterized by the presence of distinctive punctate wheals surrounded by areas of erythema, thought to be a nonimmunologic hypersensitivity reaction in which acetylcholine released from parasympathetic or motor nerve  
10           terminals induces release of mediators from mast cells, and evoked by conditions of exertion, stress, or increased environmental heat; cold urticaria which is urticaria precipitated by cold air, water, or objects, occurring in two forms: In the autosomal dominant form which is associated with fevers, arthralgias, and leukocytosis, the lesions present are erythematous, burning papules and macules, and in the more common acquired form which is usually idiopathic and self-limited; contact urticaria which is a localized or generalized transient  
15           wheal-and-flare response elicited by exposure to rapidly absorbable urticariogenic agents; giant urticaria which is angioedema; and papular urticaria which is a persistent cutaneous eruption representing a hypersensitivity reaction to insect bites.

          Accordingly, the PDE4 inhibitors of Formula (1.0.0) are useful for the beneficial treatment of the various types of urticaria as described above. A related area of therapeutic  
20           application for which the compounds of Formula (1.0.0) also produce beneficial results is in various ophthalmic uses, in particular in the treatment of conjunctivitis and uveitis.

          The conjunctiva is a delicate membrane that lines the eyelids and covers the exposed surface of the sclera. Conjunctivitis is an inflammation of the conjunctiva that generally consists of conjunctival hyperemia associated with a discharge. The most common types of  
25           conjunctivitis, which are treatable with the compounds of Formula (1.0.0), are actinic conjunctivitis produced by ultraviolet light; acute catarrhal conjunctivitis which is an acute, infectious conjunctivitis associated with cold or catarrh and characterized by vivid hyperemia, edema, loss of translucence, and mucous or mucopurulent discharge; acute contagious conjunctivitis which is a mucopurulent, epidemic conjunctivitis caused by *Haemophilus*  
30           *aegyptius* that has the same symptoms as acute catarrhal conjunctivitis and is also called "pinkeye"; allergic conjunctivitis which is a component of hay fever; atopic conjunctivitis which is allergic conjunctivitis of the immediate type caused by airborne allergens, e.g., pollens, dusts, spores, and animal dander; chronic catarrhal conjunctivitis which is a mild, chronic conjunctivitis with only slight hyperemia and mucous discharge; purulent conjunctivitis which  
35           is an acute conjunctivitis caused by bacteria or viruses, particularly gonococci, meningococci, pneumococci, and streptococci, and characterized by severe inflammation of the conjunctiva

and copious discharge of pus; and vernal conjunctivitis which is a bilateral conjunctivitis of seasonal occurrence, of unknown cause, affecting children especially boys and characterized by flattened papules and a thick, gelatinous exudate. Accordingly, the PDE4 inhibitors of Formula (1.0.0) are useful for the beneficial treatment of the various types of conjunctivitis as described above. A related area of therapeutic application for which the compounds of Formula (1.0.0) also produce beneficial results is in the treatment of uveitis.

The uvea is the vascular middle coat or tunic of the eye, comprising the iris, ciliary body, and choroid. Uveitis is an inflammation of all or part of the uvea and commonly involves the other tunics of the eye, i.e., the sclera and the cornea, and the retina as well. The most common types of uveitis, which are treatable with the compounds of Formula (1.0.0), are anterior uveitis which is uveitis involving the structures of the iris and/or ciliary body, including iritis, cyclitis, and iridocyclitis; granulomatous uveitis which is uveitis of any part of the uveal tract but particularly of the posterior portion, characterized by nodular collections of epithelioid cells and giant cells surrounded by lymphocytes; nongranulomatous uveitis which is inflammation of the anterior portion of the uveal tract, i.e., the iris and ciliary body; phacoantigenic uveitis which is one of the lens-induced uveitides is a severe anterior uveitis similar to sympathetic ophthalmia, observed weeks or even months after extracapsular lens surgery or other trauma to the capsule; and posterior uveitis which is uveitis involving the posterior segment of the eye, including choroiditis and chorioretinitis. Accordingly, the PDE4 inhibitors of Formula (1.0.0) are useful for the beneficial treatment of the various types of uveitis as described above.

### **8.8 Psoriasis**

Psoriasis is a common chronic, squamous dermatosis with polygenic inheritance and a fluctuating course that is characterized by microabscesses and spongiform pustules, as well as erythematous, dry, scaling patches of various sizes. Psoriasis is a common skin disease that affects approximately 2% of the population, and more than 1½ million patients in the US annually consult physicians for treatment. Psoriasis is usually recurrent and in some instances can be very debilitating. The etiology of psoriasis is unknown, but it appears to be an autoimmune disease with genetic predisposition.

Psoriasis involves a large T-cell infiltration in the affected regions of the skin, with CD4+ lymphocytes in the dermis and CD8+ lymphocytes in the epidermis. These lymphocytes secrete IL-2, IFN- $\gamma$ , and TNF- $\alpha$ , which alter keratinocyte proliferation and differentiation. Further, from 5% to 10% of psoriasis patients develop psoriatic arthritis, the symptoms of which are very similar to those of rheumatoid arthritis. The broad spectrum of anti-inflammatory activities displayed by PDE4 inhibitors, already discussed above, enables such inhibitors to be used beneficially in the treatment of psoriasis.

It has been demonstrated that treatment of epidermal basal cells, in primary culture, with the PDE4 inhibitor Ro 20-1724 leads to a three-fold increase in cAMP concentrations. It has also been shown that treatment of psoriatic epidermal slices and keratomed psoriatic epidermal slices with Ro 20-1724 results in a very marked elevation of cAMP concentrations over controls. Specifically, a 1395% increase in cAMP concentration in keratomed psoriatic epidermis has been observed. PDE4 inhibitors have also been shown to inhibit the inflammatory response of a number of mediators via either topical or systemic administration. For example, rolipram has been shown to inhibit croton oil-induced ear inflammation in the mouse at topical doses as low as 0.03 mg per ear. The selective PDE4 inhibitor Ro 20-1724 has also been investigated in two double-blind studies comparing its effectiveness to vehicle, where it has been shown to improve psoriatic lesions without adverse systemic or cutaneous effects.

#### **8.9 Multiple Sclerosis and Other Inflammatory Autoimmune Diseases**

A sclerosis is an induration, or hardening, and refers especially to hardening of a part from inflammation, and from increased formation of connective tissue and in diseases of the interstitial substance. The term "sclerosis" is used chiefly for such a hardening of the nervous system due to the deposition of connective tissue, or to designate hardening of the blood vessels. Multiple sclerosis (MS) is a disease in which there are foci of demyelination of various sizes throughout the white matter of the central nervous system, sometimes extending into the gray matter, resulting in weakness, incoordination, paresthesias, speech disturbances, and visual complaints. Multiple sclerosis is a disease of unknown etiology with a prolonged course involving many remissions and relapses.

Multiple sclerosis is an autoimmune disease that in addition to chronic inflammation and demyelination, also results in gliosis within the central nervous system. There are several disease subtypes, including primary progressive multiple sclerosis, and relapsing remitting multiple sclerosis. These disease subtypes may be distinguished from each other on the basis of the course of the disease, of the type of inflammation involved, and through the use of magnetic resonance imaging (MRI). It is also possible for the basic disease mechanism to change during the course of multiple sclerosis, with an inflammation-based process being replaced later by one which involves demyelination and axonal damage. See Weilbach and Gold, "Disease modifying treatments for multiple sclerosis. What is on the horizon?" *CNS Drugs* 11 133-157, 1999.

In multiple sclerosis inflammatory lesions are localized to, but prevalent throughout the white matter of the central nervous system, although sclerotic plaques characterized by demyelination are a hallmark of the disease. The development of demyelination, in turn, is caused by the necrosis of oligodendrocytes, and demyelination is associated with an infiltrate

composed mainly of T-cells and macrophages, which together with local cells such as astrocytes, microglia and microvascular brain endothelial cells, express major histocompatibility complex (MHC) class II. These cells are thus implicated in antigen presentation and an inflammatory response, and a number of pro-inflammatory cytokines, including TNF- $\alpha$ , TNF- $\beta$ , IL-1, IL-6 and IFN- $\gamma$  have been identified in the brain tissue of multiple sclerosis patients and their presence is generally associated with active lesions. TNF- $\alpha$  in particular has been the focus of attention because it mediates myelin and oligodendrocyte damage *in vitro*, induces astrocytes to express surface adhesion molecules, and is associated with disruption of the blood-brain barrier.

Animal models have been used to demonstrate the role of TNF- $\alpha$  in multiple sclerosis, e.g., in experimental allergic encephalomyelitis (EAE) administration of anti-TNF antibodies or soluble TNF receptors has been shown to provide a protective effect. See Selmaj *et al.*, "Prevention of chronic relapsing experimental autoimmune encephalomyelitis by soluble tumor necrosis factor," *J. Neuroimmunol.* 56 135-141, 1995. A direct correlation between the level of TNF- $\alpha$  mRNA and progression of EAE has also been reported. See Reeno *et al.*, "TNF-alpha expression by resident microglia and infiltrating leukocytes in the central nervous system of mice with experimental allergic encephalomyelitis: regulation by the Th1 cytokines," *J. Immunol.* 154 944-953, 1995. Further evidence demonstrating that TNF- $\alpha$  is a mediator of multiple sclerosis is the increased concentration of TNF- $\alpha$  in the cerebrospinal fluid of multiple sclerosis patients during the course of the disease. Further, a transgenic mouse overexpressing TNF- $\alpha$  in the central nervous system has shown signs of spontaneous demyelination, while a transgenic TNF- $\alpha$  knockout mouse has shown a protective effect. See Probert *et al.*, "Spontaneous inflammatory demyelinating disease in transgenic mice showing central nervous system-specific expression of tumor necrosis factor alpha," *Proc. Natl. Acad. Sci. USA* 92 11294-11298, 1995; and Liu *et al.*, "TNF is a potent anti-inflammatory cytokine in autoimmune-mediated demyelination," *Nature Med.* 4 78-83, 1998.

Since PDE4 inhibitors also reduce TNF- $\alpha$ , they are beneficial in the treatment of multiple sclerosis because TNF- $\alpha$  plays a key role in mediating multiple sclerosis, as discussed above. For example, in a marmoset model of experimental allergic encephalomyelitis rolipram has been found to suppress the appearance of clinical signs and abolish abnormalities in MRI imaging. In another study of the effects of rolipram on chronic relapsing experimental allergic encephalomyelitis in SJL mice, it has been shown that rolipram ameliorates clinical signs and pathological changes in this model. See Genain *et al.*, "Prevention of autoimmune demyelination in non-human primates by a cAMP-specific phosphodiesterase," *Proc. Natl. Acad. Sci. USA.* 92 3601-3605, 1995; and Sommer *et al.*,

"Therapeutic potential of phosphodiesterase Type 4 inhibition in chronic autoimmune demyelinating disease," *J. Neuroimmunol.* 79 54-61, 1997.

In addition to inhibiting PDE4 activity and the production of TNF- $\alpha$ , the compounds of Formula (1.0.0) also possess activity as immunosuppressive agents and are especially useful for treating autoimmune diseases in which inflammation is a component part of the autoimmune disease, or in which inflammation is part of the etiology of the autoimmune disease, or in which inflammation is otherwise involved with the autoimmune disease. Alternatively, the compounds of Formula (1.0.0) are anti-inflammatory agents useful in the treatment of inflammatory diseases in which autoimmune reactions are a component part of the inflammatory disease, or in which autoimmune reactions are part of the etiology of the inflammatory disease, or in which autoimmune reactions are otherwise involved with the inflammatory disease. Accordingly, the compounds of Formula (1.0.0) are useful in the treatment of multiple sclerosis, as discussed in detail further above.

Other autoimmune/inflammatory diseases that can be treated by therapeutic agents comprising the compounds of Formula (1.0.0) include, but are not limited to, autoimmune hematological disorders such as hemolytic anemia, aplastic anemia, pure red cell anemia, and idiopathic thrombocytopenic purpura; systemic lupus erythematosus; polychondritis; scleroderma; Wegner's granulomatosis; dermatomyositis; chronic active hepatitis; myasthenia gravis; Stevens-Johnson syndrome; idiopathic sprue; autoimmune inflammatory bowel diseases such as ulcerative colitis and Crohn's disease; endocrin opthamopathy; Grave's disease; sarcoidosis; alveolitis; chronic hypersensitivity pneumonitis; primary biliary cirrhosis; juvenile diabetes (diabetes mellitus type I); anterior uveitis and granulomatous (posterior) uveitis; keratoconjunctivitis sicca and epidemic keratoconjunctivitis; diffuse interstitial pulmonary fibrosis (interstitial lung fibrosis); idiopathic pulmonary fibrosis; cystic fibrosis; psoriatic arthritis; glomerulonephritis with and without nephrotic syndrome, including acute glomerulonephritis, idiopathic nephrotic syndrome, and minimal change nephropathy; inflammatory/hyperproliferative skin diseases including psoriasis and atopic dermatitis discussed in detail further above, contact dermatitis, allergic contact dermatitis, benign familial pemphigus, pemphigus erythematosus, pemphigus foliaceus, and pemphigus vulgaris.

Further, the compounds of Formula (1.0.0) may be used as immunosuppressant agents for the prevention of allogeneic graft rejection following organ transplantation, where such organs typically include tissue from bone marrow, bowel, heart, kidney, liver, lung, pancreas, skin and cornea.

#### **8.10 Inflammatory Bowel Disease**

Ulcerative colitis (UC) is a chronic, recurrent ulceration in the colon, chiefly of the mucosa and submucosa, which is of unknown cause, and which is manifested clinically by

cramping abdominal pain, rectal bleeding, and loose discharges of blood, pus, and mucus with scanty fecal particles. Related diseases of the bowel include collagenous colitis, which is a type of colitis of unknown etiology that is characterized by deposits of collagenous material beneath the epithelium of the colon, and marked by crampy abdominal pain with a  
5 conspicuous reduction in fluid and electrolyte absorption that leads to watery diarrhea; colitis polyposa, which is ulcerative colitis associated with the formation of pseudopolyps, i.e., edematous, inflamed islands of mucosa between areas of ulceration; and transmural colitis, which is inflammation of the full thickness of the bowel, rather than mucosal and submucosal disease, usually with the formation of noncaseating granulomas, that clinically resembles  
10 ulcerative colitis but in which the ulceration is often longitudinal or deep, the disease is often segmental, stricture formation is common, and fistulas, particularly in the perineum, are a frequent complication.

Crohn's disease (CD) is a chronic granulomatous inflammatory disease of unknown etiology involving any part of the gastrointestinal tract, but commonly involving the terminal  
15 ileum with scarring and thickening of the bowel wall, frequently leading to intestinal obstruction, and fistula and abscess formation, and having a high rate of recurrence after treatment. Ulcerative colitis, Crohn's disease and the related diseases discussed above are collectively referred to as inflammatory bowel disease (IBD). These diseases are chronic, spontaneously relapsing disorders of unknown cause that are immunologically mediated and  
20 whose pathogenesis has been established through the use of animal models and advanced immunological techniques. See Bickston and Caminelli, "Recent developments in the medical therapy of IBD," *Curr. Opin. Gastroenterol.* 14 6-10, 1998; and Murthy *et al.*, "Inflammatory bowel disease: A new wave of therapy," *Exp. Opin. Ther. Patents* 8(7) 785-818, 1998. While the incidence of ulcerative colitis has remained relatively stable, the incidence of Crohn's  
25 disease has increased significantly.

Current therapy for inflammatory bowel disease includes 5-aminosalicylic acid, corticosteroids, and immunomodulators such as azathioprine, 6-mercaptopurine, and methotrexate. These agents have a wide range of adverse side effects and do not modify the disease itself, and there is thus an ongoing need for more effective treatment agents. The  
30 compounds of Formula (1.0.0) are able to beneficially treat inflammatory bowel diseases as a result of their ability to inhibit the production of TNF- $\alpha$ , because TNF- $\alpha$  causes immune cell activation, proliferation, and mediator release in inflammatory bowel disease. See Radford-Smith and Jewell, "Cytokines and inflammatory bowel disease." *Baillieres Clin. Gastroenterol.* 10 151-164, 1996. TNF- $\alpha$  has also been detected in the stools and intestinal  
35 mucosa of patients with inflammatory bowel disease. Further, early clinical studies in Crohn's disease using TNF monoclonal antibodies have shown significant promise.

As already detailed further above, selective PDE4 inhibitors have a marked effect on the inhibition of TNF- $\alpha$  release from peripheral blood mononuclear cells after those cells have been stimulated with a wide range of mediators, both *in vitro* and *in vivo*. The selective PDE4 inhibitor arofylline has been shown to provide beneficial effects when tested in models of colitis in the rat. Further, in a dextran sulfate induced colitis model in the rat, rolipram and the selective PDE4 inhibitor LAS31025 have demonstrated beneficial effects comparable to prednisolone. Both test compounds have been shown to ameliorate bleeding and inflammatory markers. See Puig *et al.* "Curative effects of phosphodiesterase 4 inhibitors in dextran sulfate sodium induced colitis in the rat," *Gastroenterology* 114(4) A1064, 1998.

Other workers have used additional models to demonstrate the ability of selective PDE4 inhibitors to provide gastrointestinal protection. For example, it has been shown that lipopolysaccharide induced erythrocyte extravasation in rats and intestinal hypoperfusion in dogs can be attenuated with the selective PDE4 inhibitors rolipram and denbufylline. See Cardelus *et al.*, "Inhibiting LPS induced bowel erythrocyte extravasation in rats, and of mesenteric hypoperfusion in dogs, by phosphodiesterase inhibitors," *Eur. J. Pharmacol.* 299 153-159, 1996; and Cardelus *et al.*, "Protective effects of denbufylline against endotoxin induced bowel hyperplasia," *Met. Find. Exp. Clin. Pharmacol.* 17(Suppl. A) 142, 1995.

#### 8.11 Septic Shock, Renal Failure, Cachexia, and Infection

Septic shock is shock associated with overwhelming infection, most commonly infection with gram negative-bacteria, although it may be produced by other bacteria, viruses, fungi and protozoa. Septic shock is deemed to result from the action of endotoxins or other products of the infectious agent on the vascular system, causing large volumes of blood to be sequestered in the capillaries and veins. Activation of the complement and kinin systems and the release of histamine, cytokines, prostaglandins, and other mediators is also involved.

It has been shown in a model of endotoxin-induced acute renal failure in rats that the selective PDE4 inhibitor, Ro-201724, given as a post-treatment at 10  $\mu$ g/kg/min significantly increases urinary cAMP excretion; markedly attenuates endotoxin-induced increases in renal vascular resistance and decreases in renal blood flow and glomerular filtration rate. Ro-201724 has also been shown to improve survival rates for endotoxin-treated rats. See Carcillo *et al.*, *Pharmacol. Exp. Ther.* 279 1197, 1996. Pentoxifylline has also been studied in patients suffering from septic shock. In this study twenty-four individuals fulfilling the criteria for septic shock have been selected, twelve of which have received pentoxifylline at 1 mg/kg/hr over a 24-hour period, while the other twelve have served as a control group. After 24 hours it has been found that the TNF- $\alpha$  levels in the therapy group have been significantly lowered, while the IL-6 levels have been significantly increased.

In another study, it has been shown that pretreatment with pentoxifylline at 5 to 50 mg/kg i.p. 3X, or with the selective PDE4 inhibitors rolipram at 10 to 30 mg/kg i.p. 3x, and debufylline at 0.1 to 3 mg/kg i.p. 3x, reduces lipopolysaccharide-induced bowel erythrocyte extravasation in rats, and that denbufylline is 100-fold more potent than pentoxifylline in inhibiting lipopolysaccharide-induced mesenteric blood flow fall, without affecting renal blood flow or cardiac index. See Cardelus *et al.*, *Ibid.*, *Eur. J. Pharmacol.*

Renal failure is the inability of the kidney to excrete metabolites at normal plasma levels under conditions of normal loading, or the inability to retain electrolytes under conditions of normal intake. In the acute form, it is marked by uremia and usually by oliguria or anuria, with hyperkalemia and pulmonary edema. On the basis of the above-described activities of selective PDE4 inhibitors, it has been demonstrated that selective PDE4 inhibitors are useful in the treatment of renal failure, especially acute renal failure. See Begany *et al.*, "Inhibition of Type IV phosphodiesterase by Ro-20-1724 attenuates endotoxin-induced acute renal failure," *J. Pharmacol. Exp. Thera.* 278 37-41, 1996. See also WO 98/00135 assigned to the University of Pittsburgh. Accordingly, the compounds of Formula (1.0.0) are useful in the treatment of renal failure, particularly acute renal failure.

Cachexia is a profound and marked state of constitutional disorder characterized by general ill health and malnutrition. Cachexia may be the end result of a number of causative factors, e.g., it may result from infection by any one of a number of different unicellular organisms or microorganisms including bacteria, viruses, fungi, and protozoans. Malarial cachexia is representative and comprises a group of signs of a chronic nature that result from antecedent attacks of severe malaria, the principal signs being anemia, sallow skin, yellow sclera, splenomegaly, and hepatomegaly. Another cause of cachexia is the deprivation or deterioration of humoral or other organic functions, e.g., hypophysial cachexia comprises a train of symptoms resulting from total deprivation of function of the pituitary gland, including phthisis, loss of sexual function, atrophy of the pituitary target glands, bradycardia, hypothermia, apathy, and coma. Uremic cachexia is cachexia associated with other systemic symptoms of advanced renal failure. Cardiac cachexia comprises the emaciation due to heart disease. Cachexia suprarenalis, or Addison's disease, is a disorder characterized by hypotension, weight loss, anorexia, and weakness, caused by adrenocortical hormone deficiency. It is due to tuberculosis- or autoimmune-induced destruction of the adrenal cortex that results in deficiency of aldosterone and cortisol.

Cachexia may also be the result of disease states of various types. Cancerous cachexia comprises the weak, emaciated condition seen in cases of malignant tumor. Cachexia can also be a consequence of infection by the human immunodeficiency virus (HIV), and comprises the symptoms commonly referred to as acquired immune deficiency

syndrome (AIDS). The compounds of Formula (1.0.0) are useful in treating cachexia of the different types described above as a result of their ability to provide down-regulation or inhibition of TNF- $\alpha$  release. The selective PDE4 inhibitors of the present invention have a marked effect on the inhibition of TNF- $\alpha$  release from peripheral blood mononuclear cells after those cells have been stimulated with a wide range of mediators. TNF- $\alpha$  release is implicated or plays a mediating role in diseases or conditions whose etiology involves or comprises morbid, *i.e.*, unhealthy, excessive or unregulated TNF- $\alpha$  release.

The PDE4 inhibitory compounds of Formula (1.0.0) are further useful in the treatment of infection, especially infection by viruses wherein such viruses increase the production of TNF- $\alpha$  in their host, or wherein such viruses are sensitive to upregulation of TNF- $\alpha$  in their host so that their replication or other vital activities are adversely impacted. Such viruses include, *e.g.*, HIV-1, HIV-2, and HIV-3; cytomegalovirus, CMV; influenza; adenoviruses; and Herpes viruses, especially *Herpes zoster* and *Herpes simplex*.

The PDE4 inhibitory compounds of Formula (1.0.0) are further useful in the treatment of yeast and fungus infections wherein said yeast and fungi are sensitive to upregulation by TNF- $\alpha$  or elicit TNF- $\alpha$  production in their host. A particular disease which is treatable in this way is fungal meningitis. The compounds of Formula (1.0.0) also provide beneficial effects when combined with, *i.e.*, administered in conjunction with other drugs of choice for the treatment of systemic yeast and fungus infections. Such drugs of choice include, but are not limited to polymyxins, *e.g.*, Polymyxin B; imidazoles, *e.g.*, clotrimazole, econazole, miconazole, and ketoconazole; triazoles, *e.g.*, fluconazole and itraconazole; and amphotericins, *e.g.*, Amphotericin B and liposomal Amphotericin B. The term "co-administration" as used herein with reference to the compounds of Formula (1.0.0) and drugs of choice for the treatment of systemic yeast and fungus infections, is intended to mean and include (a) simultaneous administration of such compound(s) and drug(s) to a subject when formulated together into a single dosage form; (b) substantially simultaneous administration of such compound(s) and drug(s) to a subject when formulated apart from each other into separate dosage forms; and (c) sequential administration of such compound(s) and drug(s) to a subject when formulated apart from each other and administered consecutively with some significant time interval between.

#### **8.12 Liver Injury**

In addition to the above-described adverse effects of TNF- $\alpha$ , it also causes hepatic failure in humans, a phenomenon which has been shown in a number of animal models. For example, in an acute model of T-cell mediated hepatic failure, rolipram administered at 0.1 to 10 mg/kg *i.p.* 30 minutes before challenge with either concanavalin A or staphylococcal enterotoxin B, has been shown to significantly reduce plasma TNF- $\alpha$  and INF- $\gamma$

concentrations, whereas it also significantly elevates IL-10 levels. See Gantner *et al.*, *J. Pharmacol. Exp. Ther.* 280 53, 1997. In this same study, rolipram has also been shown to suppress concanavalin A-induced IL-4 release. The plasma activities of the liver specific enzymes ALT, AST, and SDH have also been assessed in this study, since any increase in  
5 their levels would indicate massive liver cell destruction. It has been found that in pretreatment of naïve mice receiving concanavalin A, or galactosamine-sensitized mice receiving galactosamine/staphylococcal enterotoxin B, with rolipram at 0.1 to 10 mg/kg i.p., that rolipram has dose-dependently inhibited the above-mentioned plasma enzyme activities. Accordingly, the compounds of Formula (1.0.0) are useful in the treatment of T-cell disorders  
10 such as liver failure.

### **8.13 Pulmonary Hypertension**

It is known that the activity of phosphodiesterases, which hydrolyze the vasodilatory second messengers cAMP and cGMP, may be increased by hypoxia-induced pulmonary hypertension (HPH). Hypoxia is a reduction of oxygen supply to tissue below physiological  
15 levels despite adequate perfusion of the tissue by blood. The resulting pulmonary hypertension is characterized by increased pressure, i.e., above 30 mm Hg systolic and above 12 mm. Hg diastolic, within the pulmonary arterial circulation. Using a model which utilizes isolated pulmonary artery rings from normal rats and from rats with hypoxia-induced pulmonary hypertension, it has been shown that the selective PDE4 inhibitor rolipram  
20 potentiates the relaxant activities of isoproterenol and forskolin. The same effect has been observed with milrinone, which is a selective PDE3 inhibitor, thereby supporting inhibition of both PDE3 and PDE4 in order to significantly improve pulmonary artery relaxation in hypoxia-induced pulmonary hypertension. See Wagner *et al.*, *J. Pharmacol. Exp. Ther.* 282 1650, 1997. Accordingly, the compounds of Formula (1.0.0) are useful in the treatment of  
25 pulmonary hypertension, especially hypoxia-induced pulmonary hypertension.

### **8.14 Bone Loss Disease**

Bone loss disease, more commonly referred to as osteoporosis, is a condition of low bone mass and microarchitectural disruption that results in fractures with minimal trauma. Secondary osteoporosis is due to systemic illness or medications such as glucocorticoids.  
30 Primary osteoporosis, it has been contended, should be viewed as comprising two conditions: Type I osteoporosis which is loss of trabecular bone due to estrogen deficiency at menopause, and Type II osteoporosis which is loss of cortical and trabecular bone due to long-term remodeling inefficiency, dietary inadequacy, and activation of the parathyroid axis with age. The primary regulators of adult bone mass include physical activity, reproductive  
35 endocrine status, and calcium intake, and optimal maintenance of bone requires sufficiency in all three areas.

It has been demonstrated that selective PDE4 inhibitors are useful in the beneficial treatment of bone loss disease, particularly osteoporosis. The effect of denbufylline on bone loss in Walker 256/S-bearing rats and on mineralized nodule formation and osteoclast-like cell formation has been studied in bone marrow culture systems. It has been discovered that serial oral administrations of denbufylline inhibit the decrease in the bone mineral density of femurs from Walker 256/S-bearing rats, and restore the bone mass and the number of osteoclasts and osteoblasts per trabecular surface in the femur metaphysis. The administration of denbufylline has also been found to result in an increase in the number of mineralized nodules and a decrease in the number of osteoclast-like cells in the *in vitro* bone marrow culture system. These beneficial effects are specific for PDE4 inhibition and are mimicked by dibutyryl cAMP, demonstrating that the PDE4 isozyme plays an important role in bone turnover through cAMP. See Miyamoto *et al.*, *Biochem. Pharmacol.* 54 613, 1997; Waki *et al.*, "Effects of XT-44, a phosphodiesterase 4 inhibitor, in osteoblastogenesis and osteoclastogenesis in culture and its therapeutic effects in rat osteopenia models," *Jpn. J. Pharmacol.* 79 477-483, 1999; and JP 9169665 assigned to Miyamoto (1997). Consequently, the selective PDE4 inhibitors of Formula (1.0.0) are useful in the treatment of diseases involving bone loss, especially osteoporosis.

#### 8.15 CNS disorders

The PDE4 selective inhibitor rolipram was initially developed as an antidepressant and continues to be studied in clinical trials for that indication. Further, it has been demonstrated that selective PDE4 inhibitors provide beneficial effects in other central nervous system disorders, including Parkinson's disease, Hulley *et al.*, "Inhibitors of Type IV phosphodiesterases reduce the toxicity of MPTP in substantia nigra neurons *in vivo*," *Eur. J. Neurosci.* 7 2431-2440, 1995; as well as learning and memory impairment, Egawa *et al.*, "Rolipram and its optical isomers, phosphodiesterase 4 inhibitors, attenuate the scopolamine-induced impairments of learning and memory in rats," *Jpn. J. Pharmacol.* 75 275-281, 1997; Imanishi *et al.*, "Ameliorating effects of rolipram on experimentally induced impairments of learning and memory in rodents," *Eur. J. Pharmacol.* 321 273-278, 1997; and Barad *et al.*, "Rolipram, a Type IV-specific phosphodiesterase inhibitor, facilitates the establishment of long-lasting long-term potentiation and improves memory," *Proc. Natl. Acad. Sci. USA* 95 15020-15025, 1998.

The use of PDE4 inhibitors to treat tardive dyskinesia and drug dependence has also been disclosed in the art, WO 95/28177 and JP 92221423 (1997), both assigned to Meiji Seika Kaisha Ltd. The PDE4 isozyme has been found to play a major role in controlling dopamine biosynthesis in mesencephalic neurons; accordingly PDE4 inhibitors are useful in the treatment of disorders and diseases which are associated with or mediated by dopamine within and around mesencephalic neurons, Yamashita *et al.*, "Rolipram, a selective inhibitor of

phosphodiesterase Type 4, pronouncedly enhances the forskolin-induced promotion of dopamine biosynthesis in primary cultured rat mesencephalic neurons," *Jpn. J. Pharmacol.* 75 91-95, 1997.

5 The PDE4 inhibitory compounds of Formula (1.0.0) are further useful in the treatment of arteriosclerotic dementia and subcortical dementia. Arteriosclerotic dementia, also called vascular dementia and multi-infarct dementia, is a dementia with a stepwise deteriorating course in the form of a series of small strokes, and an irregular distribution of neurological deficits caused by cerebrovascular disease. Subcortical dementia are caused by lesions affecting subcortical brain structures and are characterized by memory loss with slowness in  
10 processing information or making intellectual responses. Included are dementias that accompany Huntington's chorea, Wilson's disease, paralysis agitans, and thalamic atrophies.

#### 8.16 Other Therapeutic Applications

It has been demonstrated that PDE4 inhibitors are useful in the treatment of ischemia-reperfusion injury, Block *et al.*, "Delayed treatment with rolipram protects against  
15 neuronal damage following global ischemia in rats," *NeuroReport* 8 3829-3832, 1997 and Belayev *et al.* "Protection against blood-brain barrier disruption in focal cerebral ischemia by the Type IV phosphodiesterase inhibitor BBB022: a quantitative study," *Brain Res.* 787 277-285, 1998; in the treatment of autoimmune diabetes, Liang *et al.*, "The phosphodiesterase inhibitors pentoxifylline and rolipram prevent diabetes in NOD mice," *Diabetes* 47 570-575,  
20 1998; in the treatment of retinal autoimmunity, Xu *et al.*, "Protective effect of the Type IV phosphodiesterase inhibitor rolipram in EAU: protection is independent of the IL-10-inducing activity," *Invest. Ophthalmol. Visual Sci.* 40 942-950, 1999; in the treatment of chronic lymphocytic leukemia, Kim and Lerner, "Type 4 cyclic adenosine monophosphate phosphodiesterase as a therapeutic agent in chronic lymphocytic leukemia," *Blood* 92 2484-  
25 2494, 1998; in the treatment of HIV infections, Angel *et al.*, "Rolipram, a specific Type IV phosphodiesterase inhibitor, is a potent inhibitor of HIV-1 replication," *AIDS* 9 1137-1144, 1995 and Navarro *et al.*, "Inhibition of phosphodiesterase Type IV suppresses human immunodeficiency virus Type 1 replication and cytokine production in primary T cells: involvement of NF-kappaB and NFAT," *J. Virol.* 72 4712-4720, 1998; in the treatment of lupus  
30 erythematosus, JP 10067682 (1998) assigned to Fujisawa Pharm. Co. Ltd.; in the treatment of kidney and ureter disease, DE 4230755 (1994) assigned to Schering AG ; in the treatment of urogenital and gastrointestinal disorders, WO 94/06423 assigned to Schering AG ; and in the treatment of prostate diseases, WO 99/02161 assigned to Porssmann and WO 99/02161 assigned to Stief.

In accordance with the above descriptions, it will be understood that the compounds of Formula (1.0.0) are useful in the beneficial treatment of any one or more members selected from the group consisting of the following diseases, disorders, and conditions:

5       - asthma of whatever type, etiology, or pathogenesis; or asthma that is a member selected from the group consisting of atopic asthma; non-atopic asthma; allergic asthma; atopic, bronchial, IgE-mediated asthma; bronchial asthma; essential asthma; true asthma; intrinsic asthma caused by pathophysiologic disturbances; extrinsic asthma caused by environmental factors; essential asthma of unknown or inapparent cause; non-atopic asthma; bronchitic asthma; emphysematous asthma; exercise-induced asthma; occupational asthma;  
10       infective asthma caused by bacterial, fungal, protozoal, or viral infection; non-allergic asthma; incipient asthma; wheezy infant syndrome;

      - chronic or acute bronchoconstriction; chronic bronchitis; small airways obstruction; and emphysema;

15       - obstructive or inflammatory airways diseases of whatever type, etiology, or pathogenesis; or an obstructive or inflammatory airways disease that is a member selected from the group consisting of asthma; pneumoconiosis; chronic eosinophilic pneumonia; chronic obstructive pulmonary disease (COPD); COPD that includes chronic bronchitis, pulmonary emphysema or dyspnea associated therewith; COPD that is characterized by irreversible, progressive airways obstruction; adult respiratory distress syndrome (ARDS), and  
20       exacerbation of airways hyper-reactivity consequent to other drug therapy;

      - pneumoconiosis of whatever type, etiology, or pathogenesis; or pneumoconiosis that is a member selected from the group consisting of aluminosis or bauxite workers' disease; anthracosis or miners' asthma; asbestosis or steam-fitters' asthma; chalicosis or flint disease; ptilosis caused by inhaling the dust from ostrich feathers; siderosis caused by the  
25       inhalation of iron particles; silicosis or grinders' disease; byssinosis or cotton-dust asthma; and talc pneumoconiosis;

      - bronchitis of whatever type, etiology, or pathogenesis; or bronchitis that is a member selected from the group consisting of acute bronchitis; acute laryngotracheal bronchitis; arachidic bronchitis; catarrhal bronchitis; croupus bronchitis; dry bronchitis;  
30       infectious asthmatic bronchitis; productive bronchitis; staphylococcus or streptococcal bronchitis; and vesicular bronchitis;

      - bronchiectasis of whatever type, etiology, or pathogenesis; or bronchiectasis that is a member selected from the group consisting of cylindric bronchiectasis; sacculated bronchiectasis; fusiform bronchiectasis; capillary bronchiectasis; cystic bronchiectasis; dry  
35       bronchiectasis; and follicular bronchiectasis;

- 117 -

- seasonal allergic rhinitis; or perennial allergic rhinitis; or sinusitis of whatever type, etiology, or pathogenesis; or sinusitis that is a member selected from the group consisting of purulent or nonpurulent sinusitis; acute or chronic sinusitis; and ethmoid, frontal, maxillary, or sphenoid sinusitis;
- 5       – rheumatoid arthritis of whatever type, etiology, or pathogenesis; or rheumatoid arthritis that is a member selected from the group consisting of acute arthritis; acute gouty arthritis; chronic inflammatory arthritis; degenerative arthritis; infectious arthritis; Lyme arthritis; proliferative arthritis; psoriatic arthritis; and vertebral arthritis;
- gout, and fever and pain associated with inflammation;
- 10       – an eosinophil-related disorder of whatever type, etiology, or pathogenesis; or an eosinophil-related disorder that is a member selected from the group consisting of eosinophilia; pulmonary infiltration eosinophilia; Löffler's syndrome; chronic eosinophilic pneumonia; tropical pulmonary eosinophilia; bronchopneumonic aspergillosis; aspergilloma; granulomas containing eosinophils; allergic granulomatous angiitis or Churg-Strauss
- 15       syndrome; polyarteritis nodosa (PAN); and systemic necrotizing vasculitis;
- atopic dermatitis; or allergic dermatitis; or allergic or atopic eczema;
- urticaria of whatever type, etiology, or pathogenesis; or urticaria that is a member selected from the group consisting of immune-mediated urticaria; complement-mediated urticaria; urticariogenic material-induced urticaria; physical agent-induced urticaria; stress-
- 20       induced urticaria; idiopathic urticaria; acute urticaria; chronic urticaria; angioedema; cholinergic urticaria; cold urticaria in the autosomal dominant form or in the acquired form; contact urticaria; giant urticaria; and papular urticaria;
- conjunctivitis of whatever type, etiology, or pathogenesis; or conjunctivitis that is a member selected from the group consisting of actinic conjunctivitis; acute catarrhal
- 25       conjunctivitis; acute contagious conjunctivitis; allergic conjunctivitis; atopic conjunctivitis; chronic catarrhal conjunctivitis; purulent conjunctivitis; and vernal conjunctivitis
- uveitis of whatever type, etiology, or pathogenesis; or uveitis that is a member selected from the group consisting of inflammation of all or part of the uvea; anterior uveitis; iritis; cyclitis; iridocyclitis; granulomatous uveitis; nongranulomatous uveitis; phacoantigenic
- 30       uveitis; posterior uveitis; choroiditis; and chorioretinitis;
- psoriasis;
- multiple sclerosis of whatever type, etiology, or pathogenesis; or multiple sclerosis that is a member selected from the group consisting of primary progressive multiple sclerosis; and relapsing remitting multiple sclerosis;

– autoimmune/inflammatory diseases of whatever type, etiology, or pathogenesis; or an autoimmune/inflammatory disease that is a member selected from the group consisting of autoimmune hematological disorders; hemolytic anemia; aplastic anemia; pure red cell anemia; idiopathic thrombocytopenic purpura; systemic lupus erythematosus; polychondritis; scleroderma; Wegner's granulomatosis; dermatomyositis; chronic active hepatitis; myasthenia gravis; Stevens-Johnson syndrome; idiopathic sprue; autoimmune inflammatory bowel diseases; ulcerative colitis; Crohn's disease; endocrinopathy; Grave's disease; sarcoidosis; alveolitis; chronic hypersensitivity pneumonitis; primary biliary cirrhosis; juvenile diabetes or diabetes mellitus type I; anterior uveitis; granulomatous or posterior uveitis; keratoconjunctivitis sicca; epidemic keratoconjunctivitis; diffuse interstitial pulmonary fibrosis or interstitial lung fibrosis; idiopathic pulmonary fibrosis; cystic fibrosis; psoriatic arthritis; glomerulonephritis with and without nephrotic syndrome; acute glomerulonephritis; idiopathic nephrotic syndrome; minimal change nephropathy; inflammatory/hyperproliferative skin diseases; psoriasis; atopic dermatitis; contact dermatitis; allergic contact dermatitis; benign familial pemphigus; pemphigus erythematosus; pemphigus foliaceus; and pemphigus vulgaris;

– prevention of allogeneic graft rejection following organ transplantation;

– inflammatory bowel disease (IBD) of whatever type, etiology, or pathogenesis; or inflammatory bowel disease that is a member selected from the group consisting of ulcerative colitis (UC); collagenous colitis; colitis polyposa; transmural colitis; and Crohn's disease (CD);

– septic shock of whatever type, etiology, or pathogenesis; or septic shock that is a member selected from the group consisting of renal failure; acute renal failure; cachexia; malarial cachexia; hypophysial cachexia; uremic cachexia; cardiac cachexia; cachexia suprarenalis or Addison's disease; cancerous cachexia; and cachexia as a consequence of infection by the human immunodeficiency virus (HIV);

– liver injury;

– pulmonary hypertension; and hypoxia-induced pulmonary hypertension;

– bone loss diseases; primary osteoporosis; and secondary osteoporosis;

– central nervous system disorders of whatever type, etiology, or pathogenesis; or a central nervous system disorder that is a member selected from the group consisting of depression; Parkinson's disease; learning and memory impairment; tardive dyskinesia; drug dependence; arteriosclerotic dementia; and dementias that accompany Huntington's chorea, Wilson's disease, paralysis agitans, and thalamic atrophies;

– infection, especially infection by viruses wherein such viruses increase the production of TNF- $\alpha$  in their host, or wherein such viruses are sensitive to upregulation of TNF- $\alpha$  in their host so that their replication or other vital activities are adversely impacted, including a virus which is a member selected from the group consisting of HIV-1, HIV-2, and HIV-3; cytomegalovirus, CMV; influenza; adenoviruses; and Herpes viruses, including *Herpes zoster* and *Herpes simplex*;

– yeast and fungus infections wherein said yeast and fungi are sensitive to upregulation by TNF- $\alpha$  or elicit TNF- $\alpha$  production in their host, e.g., fungal meningitis; particularly when administered in conjunction with other drugs of choice for the treatment of systemic yeast and fungus infections, including but are not limited to, polymyxins, e.g., Polymycin B; imidazoles, e.g., clotrimazole, econazole, miconazole, and ketoconazole; triazoles, e.g., fluconazole and itranazole; and amphotericins, e.g., Amphotericin B and liposomal Amphotericin B.

– ischemia-reperfusion injury; autoimmune diabetes; retinal autoimmunity; chronic lymphocytic leukemia; HIV infections; lupus erythematosus; kidney and ureter disease; urogenital and gastrointestinal disorders; and prostate diseases.

#### **DETAILED DESCRIPTION OF THE INVENTION**

##### **9.0 Combination with Other Drugs and Therapies**

The present invention contemplates embodiments in which a compound of Formula (1.0.0) is the only therapeutic agent which is employed in a method of treatment described herein, whether used alone or more commonly, together with a pharmaceutically acceptable carrier to produce a suitable dosage form for administration to a patient. Other embodiments of the present invention contemplate a combination of a compound of Formula (1.0.0) together with one or more additional therapeutic agents to be co-administered to a patient to obtain some particularly desired therapeutic end result. The second, etc. therapeutic agent may also be one or more compounds of Formula (1.0.0), or one or more PDE4 inhibitors known in the art and described in detail herein. More typically, the second, etc. therapeutic agent will be selected from a different class of therapeutic agents. These selections are described in detail below.

As used herein, the terms "co-administration", "co-administered", and "in combination with", referring to the compounds of Formula (1.0.0) and one or more other therapeutic agents, is intended to mean, and does refer to and include the following: (a) simultaneous administration of such combination of compound(s) and therapeutic agent(s) to a patient in need of treatment, when such components are formulated together into a single dosage form which releases said components at substantially the same time to said patient; (b)

- 120 -

substantially simultaneous administration of such combination of compound(s) and therapeutic agent(s) to a patient in need of treatment, when such components are formulated apart from each other into separate dosage forms which are ingested at substantially the same time by said patient, whereupon said components are released at substantially the same time to said patient; (c) sequential administration of such combination of compound(s) and therapeutic agent(s) to a patient in need of treatment, when such components are formulated apart from each other into separate dosage forms which are ingested at consecutive times by said patient with a significant time interval between each ingestion, whereupon said components are released at substantially different times to said patient; and (d) sequential administration of such combination of compound(s) and therapeutic agent(s) to a patient in need of treatment, when such components are formulated together into a single dosage form which releases said components in a controlled manner whereupon they are concurrently, consecutively, and/or overlappingly ingested at the same and/or different times by said patient.

**9.1 With Leukotriene Biosynthesis Inhibitors: 5-Lipoxygenase (5-LO) Inhibitors and 5-Lipoxygenase Activating Protein (FLAP) Antagonists**

One or more compounds of Formula (1.0.0) is used in combination with leukotriene biosynthesis inhibitors, i.e., 5-lipoxygenase inhibitors and/or 5-lipoxygenase activating protein antagonists, to form embodiments of the present invention. As already adverted to above, 5-lipoxygenase (5-LO) is one of two groups of enzymes that metabolize arachidonic acid, the other group being the cyclooxygenases, COX-1 and COX-2. The 5-lipoxygenase activating protein is an 18 kDa membrane-bound, arachidonate-binding protein which stimulates the conversion of cellular arachidonic acid by 5-lipoxygenase. The arachidonic acid is converted into 5-hydroperoxyeicosatetraenoic acid (5-HPETE), and this pathway eventually leads to the production of inflammatory leukotrienes; consequently, blocking the 5-lipoxygenase activating protein or the 5-lipoxygenase enzyme itself provides a desirable target for beneficially interfering with that pathway. One such 5-lipoxygenase inhibitor is zileuton, represented by Formula (0.1.14), which may be found both above and following. Among the classes of leukotriene synthesis inhibitors which are useful for forming therapeutic combinations with the compounds of Formula (1.0.0) are the following:

(a) redox-active agents which include *N*-hydroxyureas; *N*-alkylhydroxamic acids; selenite; hydroxybenzofurans; hydroxylamines; and catechols; see Ford-Hutchinson *et al.*, "5-Lipoxygenase," *Ann. Rev. Biochem.* 63 383-417, 1994; Weitzel and Wendel, "Selenoenzymes regulate the activity of leukocyte 5-lipoxygenase via the peroxide tone," *J. Biol. Chem.* 268 6288-92, 1993; Björnstedt *et al.* "Selenite incubated with NADPH and mammalian thioredoxin reductase yields selenide, which inhibits lipoxygenase and changes the electron spin resonance spectrum of the active site iron," *Biochemistry* 35 8511-6, 1996; and Stewart *et al.*,

"Structure-activity relationships of N-hydroxyurea 5-lipoxygenase inhibitors," *J. Med. Chem.* **40** 1955-68, 1997;

(b) alkylating agents and compounds which react with SH groups have been found to inhibit leukotriene synthesis *in vitro*; see Larsson *et al.*, "Effects of 1-chloro-2,4,6-trinitrobenzene on 5-lipoxygenase activity and cellular leukotriene synthesis," *Biochem. Pharmacol.* **55** 863-71, 1998; and

(c) competitive inhibitors of 5-lipoxygenase, based on thiopyranoindole and methoxyalkyl thiazole structures which may act as non-redox inhibitors of 5-lipoxygenase; see Ford-Hutchinson *et al.*, *Ibid.*; and Hamel *et al.*, "Substituted (pyridylmethoxy)naphthalenes as potent and orally active 5-lipoxygenase inhibitors - synthesis, biological profile, and pharmacokinetics of L-739,010," *J. Med. Chem.* **40** 2866-75, 1997.

The observation that arachidonoyl hydroxyamate inhibits 5-lipoxygenase has led to the discovery of clinically useful selective 5-lipoxygenase inhibitors such as the N-hydroxyurea derivatives zileuton and ABT-761, represented by Formulas (0.1.14) and (5.2.1):

Another N-hydroxyurea compound is fenleuton (Abbott-76745) which is represented by Formula (5.2.2):

Zileuton is covered by US 4,873,259 (Summers *et al.*) assigned to Abbott Laboratories, which discloses indole, benzofuran, and benzothiophene containing lipoxygenase inhibiting compounds which may be represented by Formula (5.2.3):

where  $R_1$  is H;  $(C_1-C_4)$  alkyl;  $(C_2-C_4)$  alkenyl; or  $NR_2R^3$  where  $R_2$  and  $R_3$  are H;  $(C_1-C_4)$  alkyl; or OH; X is O; S;  $SO_2$ ; or  $NR_4$  where  $R_4$  is H;  $(C_1-C_6)$  alkyl;  $(C_1-C_6)$  alkanoyl; aroyl; or alkylsulfonyl; A is  $(C_1-C_6)$  alkylene; or  $(C_2-C_6)$  alkenylene; n is 1-5; and Y is H; halo; OH; CN; halo substituted alkyl;  $(C_1-C_{12})$  alkyl;  $(C_2-C_{12})$  alkenyl;  $(C_1-C_{12})$  alkoxy;  $(C_3-C_8)$  cycloalkyl;  $(C_1-C_8)$  thioalkyl; aryl; aryloxy; aroyl;  $(C_1-C_{12})$  arylalkyl;  $(C_2-C_{12})$  arylalkenyl;  $(C_1-C_{12})$  arylalkoxy;  $(C_1-C_{12})$  arylthioalkoxy; or substituted derivatives of aryl; aryloxy; aroyl;  $(C_1-C_{12})$  arylalkyl;  $(C_2-C_{12})$  arylalkenyl;  $(C_1-C_{12})$  arylalkoxy;  $(C_1-C_{12})$  arylthioalkoxy; where said substituent is halo;  $NO_2$ ; CN; or  $(C_1-C_{12})$  -alkyl -alkoxy and -halosubstitutedalkyl; Z is O or S; and M is H; pharmaceutically acceptable cation; aroyl; or  $(C_1-C_{12})$  alkanoyl.

Related compounds are disclosed in US 4,769,387 (Summers *et al.*); US 4,822,811 (Summers); US 4,822,809 (Summers and Stewart); US 4,897,422 (Summers); US 4,992,464 (Summers *et al.*); and US 5,250,565 (Brooks and Summers); each of which is incorporated herein by reference in its entirety as though fully set out herein.

Zileuton or any of the above-described derivatives thereof are combined with the compounds of Formula (1.0.0) to form embodiments of the present invention.

Fenleuton is disclosed in US 5,432,194; US 5,446,062; US 5,484,786; US 5,559,144; US 5,616,596; US 5,668,146; US 5,668,150; US 5,843,968; US 5,407,959; US 5,426,111; US 5,446,055; US 5,475,009; US 5,512,581; US 5,516,795; US 5,476,873; US 5,714,488; US 5,783,586; US 5,399,699; US 5,420,282; US 5,459,150; and US 5,506,261; each of which is incorporated herein by reference in its entirety as though fully set out herein. Further descriptions of such *N*-hydroxyurea and related inhibitors of 5-lipoxygenase and the synthesis of inflammatory leukotrienes may be found in WO 95/30671; WO 96/02507; WO 97/12865; WO 97/12866; WO 97/12867; WO 98/04555; and WO 98/14429.

Tepoxalin is a dual COX/5-LO inhibitor with short-lived *in vivo* activity that has led to the development of two series of hybrid compounds which are *N*-hydroxyureas and hydroxamic acids of Formulas (5.2.4) and (5.2.5), respectively:

(5.2.4)

(5.2.5)

where  $R^1$  through  $R^4$  are H; Cl;  $CH_3$ ; ethyl; *iso*-propyl; or *n*-propyl; or  $R^3$  and  $R^4$  together are  $(CH_2)_5$  or  $(CH_2)_2O(CH_2)_2$ ; and  $R^5$  is methyl; ethyl; *iso*-propyl; methoxy; trifluoromethyl;

- 123 -

chloromethyl; ethyl propionate; phenyl; 2-furyl; 3-pyridyl; or 4-pyridyl. See Connolly *et al.*, "N-Hydroxyurea and hydroxamic acid inhibitors of cyclooxygenase and 5-lipoxygenase," *Bioorganic & Medicinal Chemistry Letters* 9 979-984, 1999.

Another N-hydroxyurea compound is Abbott-79175 which is represented by Formula

5 (5.2.6):

Abbott-79175

(5.2.6)

Abbott-79175 has a longer duration of action than zileuton; Brooks *et al.*, *J. Pharm. Exp. Therapeut.* 272 724, 1995.

10

A still further N-hydroxyurea compound is Abbott-85761 which is represented by Formula (5.2.7):

Abbott-85761

(5.2.7)

Abbott-85761 is delivered to the lung by aerosol administration of a homogeneous, physically stable and nearly monodispersed formulation; Gupta *et al.*, "Pulmonary delivery of the 5-lipoxygenase inhibitor, Abbott-85761, in beagle dogs," *International Journal of Pharmaceutics* 147 207-218, 1997.

Fenleuton, Abbott-79175, Abbott-85761 or any of the above-described derivatives thereof or of tepoxalin, are combined with the compounds of Formula (1.0.0) to form  
20 embodiments of the present invention.

Since the elucidation of the 5-LO biosynthetic pathway, there has been an ongoing debate as to whether it is more advantageous to inhibit the 5-lipoxygenase enzyme or to antagonize peptido- or non-peptido leukotriene receptors. Inhibitors of 5-lipoxygenase are deemed to be superior to LT-receptor antagonists, since 5-lipoxygenase inhibitors block the  
25 action of the full spectrum of 5-LO products, whereas LT-antagonists produce narrower effects. Nevertheless, embodiments of the present invention include combinations of the compounds of Formula (1.0.0) with LT-antagonists as well as 5-LO inhibitors, as described below. Inhibitors of 5-lipoxygenase having chemical structures that differ from the classes of N-hydroxyureas and hydroxamic acids described above are also used in combination with the

compounds of Formula (1.0.0) to form further embodiments of the present invention. An example of such a different class is the *N*-(5-substituted)-thiophene-2-alkylsulfonamides of Formula (5.2.8):

(5.2.8)

where X is O or S; R' is methyl, *iso*-propyl, *n*-butyl, *n*-octyl, or phenyl; and R is *n*-pentyl, cyclohexyl, phenyl, tetrahydro-1-naphthyl, 1- or 2-naphthyl, or phenyl mono- or di-substituted by Cl, F, Br, CH<sub>3</sub>, OCH<sub>3</sub>, SCH<sub>3</sub>, SO<sub>2</sub>CH<sub>3</sub>, CF<sub>3</sub>, or *iso*-propyl. A preferred compound is that of Formula (5.2.9):

(5.2.9)

A further description of these compounds may be found in Beers *et al.*, "*N*-(5-substituted) thiophene-2-alkylsulfonamides as potent inhibitors of 5-lipoxygenase," *Bioorganic & Medicinal Chemistry* 5(4) 779-786, 1997.

Another distinct class of 5-lipoxygenase inhibitors is that of the 2,6-di-*tert*-butylphenol hydrazones described in Cuadro *et al.*, "Synthesis and biological evaluation of 2,6-di-*tert*-butylphenol hydrazones as 5-lipoxygenase inhibitors," *Bioorganic & Medicinal Chemistry* 6 173-180, 1998. Compounds of this type are represented by Formula (5.2.10):

(5.2.10)

where "Het" is benzoxazol-2-yl; benzothiazol-2-yl; pyridin-2-yl; pyrazin-2-yl; pyrimidin-2-yl; 4-phenylpyrimidin-2-yl; 4,6-diphenylpyrimidin-2-yl; 4-methylpyrimidin-2-yl; 4,6-dimethylpyrimidin-2-yl; 4-butylpyrimidin-2-yl; 4,6-dibutylpyrimidin-2-yl; and 4-methyl-6-phenylpyrimidin-2-yl.

The *N*-(5-substituted)-thiophene-2-alkylsulfonamides of Formula (5.2.8), or the 2,6-di-*tert*-butylphenol hydrazones of Formula (5.2.10), or any of the above-described derivatives thereof, are combined with the compounds of Formula (1.0.0) to form embodiments of the present invention.

- 5 A further distinct class of 5-lipoxygenase inhibitors is that of methoxytetrahydropyrans to which Zeneca ZD-2138 belongs. ZD-2138 is represented by Formula (5.2.11):

(5.2.11)

- 10 ZD-2138 is highly selective and highly active orally in a number of species and has been evaluated in the treatment of asthma and rheumatoid arthritis by oral administration. Further details concerning ZD-2138 and derivatives thereof are disclosed in *Crawley et al., J. Med. Chem.*, 35 2600, 1992; and *Crawley et al., J. Med. Chem.* 36 295, 1993.

Another distinct class of 5-lipoxygenase inhibitors is that to which the SmithKline Beecham compound SB-210661 belongs. SB-210661 is represented by Formula (5.2.12):

(5.2.12)

- 15 Two further distinct and related classes of 5-lipoxygenase inhibitors comprise a series of pyridinyl-substituted 2-cyanonaphthalene compounds and a series of 2-cyanoquinoline compounds discovered by Merck Frosst. These two classes of 5-lipoxygenase inhibitors are exemplified by L-739,010 and L-746,530, represented by Formulas (5.2.13) and (5.2.14) respectively:
- 20

L-739,010

(5.2.13)

L-746,530

(5.2.14)

Details concerning L-739,010 and L-746,530 are disclosed in Dubé *et al.*, "Quinolines as potent 5-lipoxygenase inhibitors: synthesis and biological profile of L-746,530," *Bioorganic & Medicinal Chemistry* 8 1255-1260, 1998; and in WO 95/03309 (Friesen *et al.*).

The class of methoxytetrahydropyrans including Zeneca ZD-2138 of Formula (5.2.11); or the lead compound SB-210661 of Formula (5.2.12) and the class to which it belongs; or the series of pyridinyl-substituted 2-cyanonaphthalene compounds to which L-739,010 belongs, or the series of 2-cyanoquinoline compounds to which L-746,530 belongs; or any of the above-described derivatives of any of the above-mentioned classes, are combined with the compounds of Formula (1.0.0) to form embodiments of the present invention.

In addition to the 5-lipoxygenase enzyme, the other endogenous agent which plays a significant role in the biosynthesis of the leukotrienes is the 5-lipoxygenase activating protein (FLAP). This role is an indirect one, in contrast to the direct role of the 5-lipoxygenase enzyme. Nevertheless, antagonists of the 5-lipoxygenase activating protein are employed to inhibit the cellular synthesis of leukotrienes, and as such are also used in combination with the compounds of Formula (1.0.0) to form embodiments of the present invention.

Compounds which bind to the 5-lipoxygenase activating protein and thereby block utilization of the endogenous pool of arachidonic acid which is present have been synthesized from indole and quinoline structures; see Ford-Hutchinson *et al.*, *Ibid.*; Rouzer *et al.* "MK-886, a potent and specific leukotriene biosynthesis inhibitor blocks and reverses the membrane association of 5-lipoxygenase in ionophore-challenged leukocytes," *J. Biol. Chem.* 265 1436-42, 1990; and Gorenne *et al.*, "{(R)-2-quinolin-2-yl-methoxy}phenyl)-2-cyclopentyl acetic acid} (BAY x1005), a potent leukotriene synthesis inhibitor: effects on anti-IgE challenge in human airways," *J. Pharmacol. Exp. Ther.* 268 868-72, 1994.

MK-591, which has been designated quilipon sodium, is represented by Formula (5.2.15):

- 127 -

(5.2.15)

The above-mentioned indole and quinoline classes of compounds and the specific compounds MK-591, MK-886, and BAY x 1005 to which they belong, or any of the above-described derivatives of any of the above-mentioned classes, are combined with the compounds of Formula (1.0.0) to form embodiments of the present invention.

## 9.2 With Receptor Antagonists for Leukotrienes LTB<sub>4</sub>, LTC<sub>4</sub>, LTD<sub>4</sub>, and LTE<sub>4</sub>

One or more compounds of Formula (1.0.0) is used in combination with receptor antagonists for leukotrienes LTB<sub>4</sub>, LTC<sub>4</sub>, LTD<sub>4</sub>, and LTE<sub>4</sub>. The most significant of these leukotrienes in terms of mediating inflammatory response, are LTB<sub>4</sub> and LTD<sub>4</sub>. Classes of antagonists for the receptors of these leukotrienes are described in the paragraphs which follow.

4-Bromo-2,7-dimethoxy-3H-phenothiazin-3-ones, including L-651,392, are potent receptor antagonists for LTB<sub>4</sub> that are described in US 4,939,145 (Guindon *et al.*) and US 4,845,083 (Lau *et al.*). L-651,392 is represented by Formula (5.2.16):

L-651,392

(5.2.16)

A class of amidino compounds that includes CGS-25019c is described in US 5,451,700 (Morrissey and Suh); US 5,488,160 (Morrissey); and US 5,639,768 (Morrissey and Suh). These receptor antagonists for LTB<sub>4</sub> are typified by CGS-25019c, which is represented by Formula (5.2.17):

- 128 -

CGS-25019c

(5.2.17)

Ontazolast, a member of a class of benzoxazolamines that are receptor antagonists for  $LTB_4$ , is described in EP 535 521 (Anderskewitz *et al.*); and is represented by Formula

5 (5.2.18):

Ontazolast

(5.2.18)

The same group of workers has also discovered a class of benzenecarboximidamides which are receptor antagonists for  $LTB_4$ , described in WO 97/21670 (Anderskewitz *et al.*); and WO 98/11119 (Anderskewitz *et al.*); and which are typified by BIIL 284/260, represented by Formula (5.2.19):

BIIL 284/260

(5.2.19)

Zafirlukast is a receptor antagonist for  $LTC_4$ ,  $LTD_4$ , and  $LTE_4$  which is sold commercially under the name Accolate®. It belongs to a class of heterocyclic amide derivatives described in US 4,859,692 (Bernstein *et al.*); US 5,319,097 (Holohan and Edwards); US 5,294,636 (Edwards and Sherwood); US 5,482,963; US 5,583,152 (Bernstein *et al.*); and US 5,612,367 (Timko *et al.*). Zafirlukast is represented by Formula (5.2.20):

- 129 -

Zafirlukast

(5.2.20)

Ablukast is a receptor antagonist for LTD<sub>4</sub> that is designated Ro 23-3544/001, and is represented by Formula (5.2.21):

Ablukast

(5.2.21)

Montelukast is a receptor antagonist for LTD<sub>4</sub> which is sold commercially under the name Singulair® and is described in US 5,565,473. Montelukast is represented by Formula (5.2.22):

Montelukast

(5.2.22)

Other receptor antagonists for LTD<sub>4</sub> include pranlukast, verlukast (MK-679), RG-12525, Ro-245913, iralukast (CGP 45715A), and BAY x 7195.

The above-mentioned phenothiazin-3-one class of compounds, including L-651,392; the class of amidino compounds that includes CGS-25019c; the class of benzoxalamines which includes Ontazolast; the class of benzenecarboximidamides which is typified by BIL 284/260; the heterocyclic amide derivatives including Zafirlukast; Ablukast and Montelukast and the classes of compounds to which they belong; or any of the above-described derivatives of any of the above-mentioned classes, are combined with the compounds of Formula (1.0.0) to form embodiments of the present invention.

### 9.3 With Other Therapeutic Agents to Form Further Combinations

One or more compounds of Formula (1.0.0) are used together with other therapeutic agents as well as non-therapeutic agents to form combinations that are further embodiments of the present invention and that are useful in the treatment of a significant number of different diseases, disorders, and conditions described herein. Said embodiments comprise one or more compounds of Formula (1.0.0) together with one or more of the following:

PDE4 inhibitors including inhibitors of the isoform PDE4D;

5-Lipoxygenase (5-LO) inhibitors; or 5-lipoxygenase activating protein (FLAP) antagonists;

10 Dual inhibitors of 5-lipoxygenase (5-LO) and antagonists of platelet activating factor (PAF);

Leukotriene antagonists (LTRAs) including antagonists of LTB<sub>4</sub>, LTC<sub>4</sub>, LTD<sub>4</sub>, and LTE<sub>4</sub>;

15 Antihistaminic H<sub>1</sub> receptor antagonists including cetirizine, loratadine, desloratadine, fexofenadine, astemizole, azelastine, and chlorpheniramine;

Gastroprotective H<sub>2</sub> receptor antagonists;

20  $\alpha_1$ - and  $\alpha_2$ -adrenoceptor agonist vasoconstrictor sympathomimetic agents administered orally or topically for decongestant use, including propylhexedrine, phenylephrine, phenylpropanolamine, pseudoephedrine, naphazoline hydrochloride, oxymetazoline hydrochloride, tetrahydrozoline hydrochloride, xylometazoline hydrochloride, and ethylnorepinephrine hydrochloride;

$\alpha_1$ - and  $\alpha_2$ -adrenoceptor agonists in combination with inhibitors of 5-lipoxygenase (5-LO);

25 Anticholinergic agents including ipratropium bromide, tiotropium bromide, oxitropium bromide, perenzepine, and telenzepine;

$\beta_1$ - to  $\beta_4$ -adrenoceptor agonists including metaproterenol, isoproterenol, isoprenaline, albuterol, salbutamol, formoterol, salmeterol, terbutaline, orciprenaline, bitolterol mesylate, and pirbuterol;

Theophylline and aminophylline;

30 Sodium cromoglycate;

Muscarinic receptor (M1, M2, and M3) antagonists;

COX-1 inhibitors (NSAIDs); COX-2 selective inhibitors including rofecoxib; and nitric oxide NSAIDs;

Insulin-like growth factor type I (IGF-1) mimetics;

Ciclesonide;

- 5        Inhaled glucocorticoids with reduced systemic side effects, including prednisone, prednisolone, flunisolide, triamcinolone acetonide, beclomethasone dipropionate, budesonide, fluticasone propionate, and mometasone furoate;

Tryptase inhibitors;

Platelet activating factor (PAF) antagonists;

- 10       Monoclonal antibodies active against endogenous inflammatory entities;

IPL 576;

Anti-tumor necrosis factor (TNF $\alpha$ ) agents including Etanercept, Infliximab, and D2E7;

DMARDs including Leflunomide;

TCR peptides;

- 15       Interleukin converting enzyme (ICE) inhibitors;

IMPDH inhibitors;

Adhesion molecule inhibitors including VLA-4 antagonists;

Cathepsins;

MAP kinase inhibitors;

- 20       Glucose-6 phosphate dehydrogenase inhibitors;

Kinin-B<sub>1</sub> - and B<sub>2</sub> -receptor antagonists;

Gold in the form of an aurothio group together with various hydrophilic groups;

Immunosuppressive agents, e.g., cyclosporine, azathioprine, and methotrexate;

Anti-gout agents, e.g., colchicine;

- 25       Xanthine oxidase inhibitors, e.g., allopurinol;

Uricosuric agents, e.g., probenecid, sulfinpyrazone, and benzbromarone;

Antineoplastic agents, especially antimitotic drugs including the vinca alkaloids such as vinblastine and vincristine;

Growth hormone secretagogues;

- 132 -

Inhibitors of matrix metalloproteases (MMPs), *i.e.*, the stromelysins, the collagenases, and the gelatinases, as well as aggrecanase; especially collagenase-1 (MMP-1), collagenase-2 (MMP-8), collagenase-3 (MMP-13), stromelysin-1 (MMP-3), stromelysin-2 (MMP-10), and stromelysin-3 (MMP-11);

- 5           Transforming growth factor (TGF $\beta$ );
- Platelet-derived growth factor (PDGF);
- Fibroblast growth factor, *e.g.*, basic fibroblast growth factor (bFGF);
- Granulocyte macrophage colony stimulating factor (GM-CSF);
- Capsaicin cream;
- 10          Tachykinin NK-1, NK-1/NK-2, NK-2, and NK-3 receptor antagonists, including NKP-608C, SB-233412 (talnetant), and D-4418;
- Elastase inhibitors including UT-77, and ZD-0892; and
- Adenosine A2a receptor agonists.

15   **DETAILED DESCRIPTION OF THE INVENTION**  
10.0   **Pharmaceutical Compositions and Formulations**

          The description which follows concerns the manner in which the compounds of Formula (1.0.0), together with other therapeutic agents or non-therapeutic agents where these are desired, are combined with what are for the most part conventional  
20   pharmaceutically acceptable carriers to form dosage forms suitable for the different routes of administration which are utilized for any given patient, as well as appropriate to the disease, disorder, or condition for which any given patient is being treated.

          The pharmaceutical compositions of the present invention comprise any one or more of the above-described inhibitory compounds of the present invention, or a pharmaceutically  
25   acceptable salt thereof as also above-described, together with a pharmaceutically acceptable carrier in accordance with the properties and expected performance of such carriers which are well-known in the pertinent art.

          The amount of active ingredient that may be combined with the carrier materials to produce a single dosage form will vary depending upon the host treated, and the particular  
30   mode of administration. It should be understood, however, that a specific dosage and treatment regimen for any particular patient will depend upon a variety of factors, including the activity of the specific compound employed, the age, body weight, general health, sex, diet, time of administration, rate of excretion, drug combination, and the judgment of the treating

physician and the severity of the particular disease being treated. The amount of active ingredient may also depend upon the therapeutic or prophylactic agent, if any, with which the ingredient is co-administered.

5 The above-described compounds of the present invention may be utilized in the form of acids, esters, or other chemical classes of compounds to which the compounds described belong. It is also within the scope of the present invention to utilize those compounds in the form of pharmaceutically acceptable salts derived from various organic and inorganic acids and bases in accordance with procedures described in detail above and well known in the art. An active ingredient comprising a compound of Formula (1.0.0) is often utilized in the form of  
10 a salt thereof, especially where said salt form confers on said active ingredient improved pharmacokinetic properties as compared to the free form of said active ingredient or some other salt form of said active ingredient utilized previously. The pharmaceutically acceptable salt form of said active ingredient may also initially confer a desirable pharmacokinetic property on said active ingredient which it did not previously possess, and may even  
15 positively affect the pharmacodynamics of said active ingredient with respect to its therapeutic activity in the body.

The pharmacokinetic properties of said active ingredient which may be favorably affected include, e.g., the manner in which said active ingredient is transported across cell membranes, which in turn may directly and positively affect the absorption, distribution,  
20 biotransformation and excretion of said active ingredient. While the route of administration of the pharmaceutical composition is important, and various anatomical, physiological and pathological factors can critically affect bioavailability, the solubility of said active ingredient is usually dependent upon the character of the particular salt form thereof which it utilized. Further, as the artisan understands, an aqueous solution of said active ingredient will provide  
25 the most rapid absorption of said active ingredient into the body of a patient being treated, while lipid solutions and suspensions, as well as solid dosage forms, will result in less rapid absorption of said active ingredient. Oral ingestion of said active ingredient is the most preferred route of administration for reasons of safety, convenience, and economy, but absorption of such an oral dosage form can be adversely affected by physical characteristics  
30 such as polarity, emesis caused by irritation of the gastrointestinal mucosa, destruction by digestive enzymes and low pH, irregular absorption or propulsion in the presence of food or other drugs, and metabolism by enzymes of the mucosa, the intestinal flora, or the liver. Formulation of said active ingredient into different pharmaceutically acceptable salt forms may be effective in overcoming or alleviating one or more of the above-recited problems  
35 encountered with absorption of oral dosage forms.

Among the pharmaceutical salts recited further above, those which are preferred include, but are not limited to acetate, besylate, citrate, fumarate, gluconate, hemisuccinate, hippurate, hydrochloride, hydrobromide, isethionate, mandelate, meglumine, nitrate, oleate, phosphonate, pivalate, sodium phosphate, stearate, sulfate, sulfosalicylate, tartrate, thiomalate, tosylate, and tromethamine.

Multiple salts forms are included within the scope of the present invention where a compound of the present invention contains more than one group capable of forming such pharmaceutically acceptable salts. Examples of typical multiple salt forms include, but are not limited to bitartrate, diacetate, difumarate, dimeglumine, diphosphate, disodium, and trihydrochloride.

The pharmaceutical compositions of the present invention comprise any one or more of the above-described inhibitory compounds of the present invention, or a pharmaceutically acceptable salt thereof as also above-described, together with a pharmaceutically acceptable carrier in accordance with the properties and expected performance of such carriers which are well-known in the pertinent art.

The term "carrier" as used herein includes acceptable diluents, excipients, adjuvants, vehicles, solubilization aids, viscosity modifiers, preservatives and other agents well known to the artisan for providing favorable properties in the final pharmaceutical composition. In order to illustrate such carriers, there follows a brief survey of pharmaceutically acceptable carriers that may be used in the pharmaceutical compositions of the present invention, and thereafter a more detailed description of the various types of ingredients. Typical carriers include but are by no means limited to, ion exchange compositions; alumina; aluminum stearate; lecithin; serum proteins, e.g., human serum albumin; phosphates; glycine; sorbic acid; potassium sorbate; partial glyceride mixtures of saturated vegetable fatty acids; hydrogenated palm oils; water; salts or electrolytes, e.g., prolamine sulfate, disodium hydrogen phosphate, potassium hydrogen phosphate, sodium chloride, and zinc salts; colloidal silica; magnesium trisilicate; polyvinyl pyrrolidone; cellulose-based substances; e.g., sodium carboxymethylcellulose; polyethylene glycol; polyacrylates; waxes; polyethylene-polyoxypropylene-block polymers; and wool fat.

More particularly, the carriers used in the pharmaceutical compositions of the present invention comprise various classes and species of additives which are members independently selected from the groups consisting essentially of those recited in the following paragraphs.

Acidifying and alkalizing agents are added to obtain a desired or predetermined pH and comprise acidifying agents, e.g., acetic acid, glacial acetic acid, malic acid, and propionic acid. Stronger acids such as hydrochloric acid, nitric acid and sulfuric acid may be used but

are less preferred. Alkalizing agents include, e.g., edetol, potassium carbonate, potassium hydroxide, sodium borate, sodium carbonate, and sodium hydroxide. Alkalizing agents which contain active amine groups, such as diethanolamine and triethylamine, may also be used.

5 Aerosol propellants are required where the pharmaceutical composition is to be delivered as an aerosol under significant pressure. Such propellants include, e.g., acceptable fluorochlorohydrocarbons such as dichlorodifluoromethane, dichlorotetrafluoroethane, and trichloromonofluoromethane; nitrogen; or a volatile hydrocarbon such as butane, propane, isobutane or mixtures thereof.

10 Antimicrobial agents including antibacterial, antifungal and antiprotozoal agents are added where the pharmaceutical composition is topically applied to areas of the skin which are likely to have suffered adverse conditions or sustained abrasions or cuts which expose the skin to infection by bacteria, fungi or protozoa. Antimicrobial agents include such compounds as benzyl alcohol, chlorobutanol, phenylethyl alcohol, phenylmercuric acetate, potassium sorbate, and sorbic acid. Antifungal agents include such compounds as benzoic  
15 acid, butylparaben, ethylparaben, methylparaben, propylparaben, and sodium benzoate.

Antimicrobial preservatives are added to the pharmaceutical compositions of the present invention in order to protect them against the growth of potentially harmful microorganisms, which usually invade the aqueous phase, but in some cases can also grow in the oil phase of a composition. Thus, preservatives with both aqueous and lipid solubility  
20 are desirable. Suitable antimicrobial preservatives include, e.g., alkyl esters of *p*-hydroxybenzoic acid, propionate salts, phenoxyethanol, methylparaben sodium, propylparaben sodium, sodium dehydroacetate, benzalkonium chloride, benzethonium chloride, benzyl alcohol, hydantoin derivatives, quaternary ammonium compounds and cationic polymers, imidazolidinyl urea, diazolidinyl urea, and trisodium ethylenediamine  
25 tetracetate (EDTA). Preservatives are preferably employed in amounts ranging from about 0.01% to about 2.0% by weight of the total composition.

Antioxidants are added to protect all of the ingredients of the pharmaceutical composition from damage or degradation by oxidizing agents present in the composition itself or the use environment, e.g., anoxomer, ascorbyl palmitate, butylated hydroxyanisole,  
30 butylated hydroxytoluene, hypophosphorous acid, potassium metabisulfite, propyl octyl and dodecyl gallate, sodium metabisulfite, sulfur dioxide, and tocopherols.

Buffering agents are used to maintain a desired pH of a composition once established, from the effects of outside agents and shifting equilibria of components of the composition. The buffering may be selected from among those familiar to the artisan skilled  
35 in the preparation of pharmaceutical compositions, e.g., calcium acetate, potassium metaphosphate, potassium phosphate monobasic, and tartaric acid.

Chelating agents are used to help maintain the ionic strength of the pharmaceutical composition and bind to and effectively remove destructive compounds and metals, and include, e.g., edetate dipotassium, edetate disodium, and edetic acid.

5 Dermatologically active agents are added to the pharmaceutical compositions of the present invention where they are to be applied topically, and include, e.g., wound healing agents such as peptide derivatives, yeast, panthenol, hexylresorcinol, phenol, tetracycline hydrochloride, lamin and kinetin; retinoids for treating skin cancer, e.g., retinol, tretinoin, isotretinoin, etretinate, acitretin, and arotinoid; mild antibacterial agents for treating skin infections, e.g., resorcinol, salicylic acid, benzoyl peroxide, erythromycin-benzoyl peroxide, 10 erythromycin, and clindamycin; antifungal agents for treating tinea corporis, tinea pedis, candidiasis and tinea versicolor, e.g., griseofulvin, azoles such as miconazole, econazole, itraconazole, fluconazole, and ketoconazole, and allylamines such as naftifine and terfenafine; antiviral agents for treating cutaneous herpes simplex, herpes zoster, and chickenpox, e.g., acyclovir, famciclovir, and valacyclovir; antihistamines for treating pruritis, atopic and contact 15 dermatitis, e.g., diphenhydramine, terfenadine, astemizole, loratadine, cetirizine, acrivastine; and temelastine; topical anesthetics for relieving pain, irritation and itching, e.g., benzocaine, lidocaine, dibucaine, and pramoxine hydrochloride; topical analgesics for relieving pain and inflammation, e.g., methyl salicylate, camphor, menthol, and resorcinol; topical antiseptics for preventing infection, e.g., benzalkonium chloride and povidone-iodine; and vitamins and 20 derivatives thereof such as tocopherol, tocopherol acetate, retinoic acid and retinol.

Dispersing and suspending agents are used as aids for the preparation of stable formulations and include, e.g., poligeenan, povidone, and silicon dioxide.

Emollients are agents, preferably non-oily and water-soluble, which soften and soothe the skin, especially skin that has become dry because of excessive loss of water. Such 25 agents are used with pharmaceutical compositions of the present invention which are intended for topical applications, and include, e.g., hydrocarbon oils and waxes, triglyceride esters, acetylated monoglycerides, methyl and other alkyl esters of  $C_{10}$  -  $C_{20}$  fatty acids,  $C_{10}$  -  $C_{20}$  fatty acids,  $C_{10}$  -  $C_{20}$  fatty alcohols, lanolin and derivatives, polyhydric alcohol esters such as polyethylene glycol (200-600), polyoxyethylene sorbitan fatty acid esters, wax esters, 30 phospholipids, and sterols; emulsifying agents used for preparing oil-in-water emulsions; excipients, e.g., laurocapram and polyethylene glycol monomethyl ether; humectants, e.g., sorbitol, glycerin and hyaluronic acid; ointment bases, e.g., petrolatum, polyethylene glycol, lanolin, and poloxamer; penetration enhancers, e.g., dimethyl isosorbide, diethyl-glycol-monoethylether, 1-dodecylazacycloheptan-2-one, and dimethylsulfoxide (DMSO); 35 preservatives, e.g., benzalkonium chloride, benzethonium chloride, alkyl esters of p-hydroxybenzoic acid, hydantoin derivatives, cetylpyridinium chloride, propylparaben,

quaternary ammonium compounds such as potassium benzoate, and thimerosal; sequestering agents comprising cyclodextrins; solvents, e.g., acetone, alcohol, amylene hydrate, butyl alcohol, corn oil, cottonseed oil, ethyl acetate, glycerin, hexylene glycol, isopropyl alcohol, isostearyl alcohol, methyl alcohol, methylene chloride, mineral oil, peanut oil, phosphoric acid, polyethylene glycol, polyoxypropylene 15 stearyl ether, propylene glycol, propylene glycol diacetate, sesame oil, and purified water; stabilizers, e.g., calcium saccharate and thymol; surfactants, e.g., lauryl chloride; laureth 4, i.e.,  $\alpha$ -dodecyl- $\omega$ -hydroxy-poly(oxy-1,2-ethanediyl) or polyethylene glycol monododecyl ether.

Emulsifying agents, including emulsifying and stiffening agents and emulsion adjuncts, are used for preparing oil-in-water emulsions when these form the basis of the pharmaceutical compositions of the present invention. Such emulsifying agents include, e.g., non-ionic emulsifiers such as  $C_{10}$  - $C_{20}$  fatty alcohols and said fatty alcohols condensed with from 2 to 20 moles of ethylene oxide or propylene oxide, ( $C_6$  - $C_{12}$ )alkyl phenols condensed with from 2 to 20 moles of ethylene oxide, mono- and di-  $C_{10}$  - $C_{20}$  fatty acid esters of ethylene glycol,  $C_{10}$  - $C_{20}$  fatty acid monoglyceride, diethylene glycol, polyethylene glycols of MW 200-6000, polypropylene glycols of MW 200-3000, and particularly sorbitol, sorbitan, polyoxyethylene sorbitol, polyoxyethylene sorbitan, hydrophilic wax esters, cetostearyl alcohol, oleyl alcohol, lanolin alcohols, cholesterol, mono- and di-glycerides, glyceryl monostearate, polyethylene glycol monostearate, mixed mono- and distearic esters of ethylene glycol and polyoxyethylene glycol, propylene glycol monostearate, and hydroxypropyl cellulose. Emulsifying agents which contain active amine groups may also be used and typically include anionic emulsifiers such as fatty acid soaps, e.g., sodium, potassium and triethanolamine soaps of  $C_{10}$  - $C_{20}$  fatty acids; alkali metal, ammonium or substituted ammonium ( $C_{10}$  - $C_{30}$ )alkyl sulfates, ( $C_{10}$  - $C_{30}$ )alkyl sulfonates, and ( $C_{10}$  - $C_{50}$ )alkyl ethoxy ether sulfonates. Other suitable emulsifying agents include castor oil and hydrogenated castor oil; lecithin; and polymers of 2-propenoic acid together with polymers of acrylic acid, both cross-linked with allyl ethers of sucrose and/or pentaerythritol, having varying viscosities and identified by product names carbomer 910, 934, 934P, 940, 941, and 1342. Cationic emulsifiers having active amine groups may also be used, including those based on quaternary ammonium, morpholinium and pyridinium compounds. Similarly, amphoteric emulsifiers having active amine groups, such as cocobetaines, lauryl dimethylamine oxide and cocoylimidazoline, may be used. Useful emulsifying and stiffening agents also include cetyl alcohol and sodium stearate; and emulsion adjuncts such as oleic acid, stearic acid, and stearyl alcohol.

Excipients include, e.g., laurocapram and polyethylene glycol monomethyl ether.

Where the pharmaceutical composition of the present invention is to be applied topically, penetration enhancers may be used, which include, e.g., dimethyl isosorbide, diethyl-glycol-monoethylether, 1-dodecylazacycloheptan-2-one, and dimethylsulfoxide (DMSO). Such compositions will also typically include ointment bases, e.g., petrolatum, 5 polyethylene glycol, lanolin, and poloxamer, which is a block copolymer of polyoxyethylene and polyoxypropylene, which may also serve as a surfactant or emulsifying agent.

Preservatives are used to protect pharmaceutical compositions of the present invention from degradative attack by ambient microorganisms, and include, e.g., benzalkonium chloride, benzethonium chloride, alkyl esters of p-hydroxybenzoic acid, 10 hydantoin derivatives, cetylpyridinium chloride, monothioglycerol, phenol, phenoxyethanol, methylparagen, imidazolidinyl urea, sodium dehydroacetate, propylparaben, quaternary ammonium compounds, especially polymers such as polixetonium chloride, potassium benzoate, sodium formaldehyde sulfoxylate, sodium propionate, and thimerosal.

Sequestering agents are used to improve the stability of the pharmaceutical 15 compositions of the present invention and include, e.g., the cyclodextrins which are a family of natural cyclic oligosaccharides capable of forming inclusion complexes with a variety of materials, and are of varying ring sizes, those having 6-, 7- and 8-glucose residues in a ring being commonly referred to as  $\alpha$ -cyclodextrins,  $\beta$ -cyclodextrins, and  $\gamma$ -cyclodextrins, respectively. Suitable cyclodextrins include, e.g.,  $\alpha$ -cyclodextrin,  $\beta$ -cyclodextrin, 20  $\gamma$ -cyclodextrin,  $\delta$ -cyclodextrin and cationized cyclodextrins.

Solvents which may be used in preparing the pharmaceutical compositions of the present invention include, e.g., acetone, alcohol, amylene hydrate, butyl alcohol, corn oil, cottonseed oil, ethyl acetate, glycerin, hexylene glycol, isopropyl alcohol, isostearyl alcohol, methyl alcohol, methylene chloride, mineral oil, peanut oil, phosphoric acid, polyethylene 25 glycol, polyoxypropylene 15 stearyl ether, propylene glycol, propylene glycol diacetate, sesame oil, and purified water.

Stabilizers which are suitable for use include, e.g., calcium saccharate and thymol.

Stiffening agents are typically used in formulations for topical applications in order to provide desired viscosity and handling characteristics and include, e.g., cetyl esters wax, 30 myristyl alcohol, parafin, synthetic parafin, emulsifying wax, microcrystalline wax, white wax and yellow wax.

Sugars are often used to impart a variety of desired characteristics to the pharmaceutical compositions of the present invention and in order to improve the results obtained, and include, e.g., monosaccharides, disaccharides and polysaccharides such as

glucose, xylose, fructose, reose, ribose, pentose, arabinose, allose, tallose, altrose, mannose, galactose, laciase, sucrose, erythrose, glyceraldehyde, or any combination thereof.

Surfactants are employed to provide stability for multi-component pharmaceutical compositions of the present invention, enhance existing properties of those compositions, and bestow desirable new characteristics on said compositions. Surfactants are used as wetting agents, antifoam agents, for reducing the surface tension of water, and as emulsifiers, dispersing agents and penetrants, and include, e.g., lapyrium chloride; laureth 4, *i.e.*,  $\alpha$ -dodecyl- $\omega$ -hydroxy-poly(oxy-1,2-ethanediyl) or polyethylene glycol monododecyl ether; laureth 9, *i.e.*, a mixture of polyethylene glycol monododecyl ethers averaging about 9 ethylene oxide groups per molecule; monoethanolamine; nonoxynol 4, 9 and 10, *i.e.*, polyethylene glycol mono(*p*-nonylphenyl) ether; nonoxynol 15, *i.e.*,  $\alpha$ -(*p*-nonylphenyl)- $\omega$ -hydroxypenta-deca(oxyethylene); nonoxynol 30, *i.e.*,  $\alpha$ -(*p*-nonylphenyl)- $\omega$ -hydroxytriaconta(oxyethylene); poloxalene, *i.e.*, nonionic polymer of the polyethylene-polypropylene glycol type, MW = approx. 3000; poloxamer, referred to in the discussion of ointment bases further above; polyoxyl 8, 40 and 50 stearate, *i.e.*, poly(oxy-1,2-ethanediyl),  $\alpha$ -hydro- $\omega$ -hydroxy-; octadecanoate; polyoxyl 10 oleyl ether, *i.e.*, poly(oxy-1,2-ethanediyl),  $\alpha$ -[(*Z*)-9-octadecenyl- $\omega$ -hydroxy-; polysorbate 20, *i.e.*, sorbitan, monododecanoate, poly(oxy-1,2-ethanediyl); polysorbate 40, *i.e.*, sorbitan, monohexadecanoate, poly(oxy-1,2-ethanediyl); polysorbate 60, *i.e.*, sorbitan, monooctadecanoate, poly(oxy-1,2-ethanediyl); polysorbate 65, *i.e.*, sorbitan, trioctadecanoate, poly(oxy-1,2-ethanediyl); polysorbate 80, *i.e.*, sorbitan, mono-9-monodecenoate, poly(oxy-1,2-ethanediyl); polysorbate 85, *i.e.*, sorbitan, tri-9-octadecenoate, poly(oxy-1,2-ethanediyl); sodium lauryl sulfate; sorbitan monolaurate; sorbitan monooleate; sorbitan monopalmitate; sorbitan monostearate; sorbitan sesquioleate; sorbitan trioleate; and sorbitan tristearate.

The pharmaceutical compositions of the present invention may be prepared using very straightforward methodology which is well understood by the artisan of ordinary skill. Where the pharmaceutical compositions of the present invention are simple aqueous and/or other solvent solutions, the various components of the overall composition are brought together in any practical order, which will be dictated largely by considerations of convenience. Those components having reduced water solubility, but sufficient solubility in the same co-solvent with water, may all be dissolved in said co-solvent, after which the co-solvent solution will be added to the water portion of the carrier whereupon the solutes therein will become dissolved in the water. To aid in this dispersion/solution process, a surfactant may be employed.

Where the pharmaceutical compositions of the present invention are to be in the form of emulsions, the components of the pharmaceutical composition will be brought together in

accordance with the following general procedures. The continuous water phase is first heated to a temperature in the range of from about 60° to about 95°C, preferably from about 70° to about 85°C, the choice of which temperature to use being dependent upon the physical and chemical properties of the components which make up the oil-in-water emulsion. Once the continuous water phase has reached its selected temperature, the components of the final composition to be added at this stage are admixed with the water and dispersed therein under high-speed agitation. Next, the temperature of the water is restored to approximately its original level, after which the components of the composition which comprise the next stage are added to the composition mixture under moderate agitation and mixing continues for from about 5 to about 60 minutes, preferably about 10 to about 30 minutes, depending on the components of the first two stages. Thereafter, the composition mixture is passively or actively cooled to from about 20° to about 55°C for addition of any components in the remaining stages, after which water is added in sufficient quantity to reach its original predetermined concentration in the overall composition.

According to the present invention, the pharmaceutical compositions may be in the form of a sterile injectable preparation, for example a sterile injectable aqueous or oleaginous suspension. This suspension may be formulated according to techniques known in the art using suitable dispersing or wetting agents and suspending agents. The sterile injectable preparation may also be a sterile injectable solution or suspension in a non-toxic parenterally-acceptable diluent or solvent, for example as a solution in 1,3-butanediol. Among the acceptable vehicles and solvents that may be employed are water, Ringer's solution and isotonic sodium chloride solution. In addition, sterile, fixed oils are conventionally employed as a solvent or suspending medium. For this purpose, any bland fixed oil may be employed including synthetic mono- or di-glycerides. Fatty acids, such as oleic acid and its glyceride derivatives are useful in the preparation of injectables, as do natural pharmaceutically-acceptable oils, such as olive oil or castor oil, especially in their polyoxyethylated versions. These oil solutions or suspensions may also contain a long-chain alcohol diluent or dispersant, such as *Rh*, HCIX or similar alcohol.

The pharmaceutical compositions of the present invention may be orally administered in any orally acceptable dosage form including, but not limited to, capsules, tablets, aqueous suspensions or solutions. In the case of tablets for oral use, carriers which are commonly used include lactose and corn starch. Lubricating agents, such as magnesium stearate, are also typically added. For oral administration in a capsule form, useful diluents include lactose and dried corn starch. When aqueous suspensions are required for oral use, the active ingredient is combined with emulsifying and suspending agents. If desired, certain sweetening, flavoring or coloring agents may also be added. Alternatively, the

pharmaceutical compositions of this invention may be administered in the form of suppositories for rectal administration. These can be prepared by mixing the agent with a suitable non-irritating excipient which is solid at room temperature but liquid at the rectal temperature and therefore will melt in the rectum to release the drug. Such materials include  
5 cocoa butter, beeswax and polyethylene glycols.

The pharmaceutical compositions of the present invention may also be administered topically, especially when the target of treatment includes areas or organs readily accessible by topical application, including diseases of the eye, the skin, or the lower intestinal tract. Suitable topical formulations are readily prepared for each of these areas or organs.

10 Topical application for the lower intestinal tract can be effected in a rectal suppository formulation, as described above, or in a suitable enema formulation. Topically active transdermal patches may also be used.

For topical applications, the pharmaceutical compositions may be formulated in a suitable ointment containing the active component suspended or dissolved in one or more  
15 carriers. Carriers for topical administration of the compounds of this invention include, but are not limited to, mineral oil, liquid petrolatum, white petrolatum, propylene glycol, polyoxyethylene, polyoxypropylene compound, emulsifying wax and water. Alternatively, the pharmaceutical compositions can be formulated in a suitable lotion or cream containing the active components suspended or dissolved in one or more pharmaceutically acceptable  
20 carriers. Suitable carriers include, but are not limited to, mineral oil, sorbitan monostearate, polysorbate, cetyl esters wax, cetearyl alcohol, 2-octyldodecanol, benzyl alcohol and water.

Pharmaceutical compositions within the scope of the present invention include those wherein the therapeutically effective amount of an active ingredient comprising a compound of the present invention required for treating or preventing diseases, disorders, and conditions  
25 mediated by or associated with modulation of PDE4 activity as described herein, is provided in a dosage form suitable for systemic administration. Such a pharmaceutical composition will contain said active ingredient in suitable liquid form for delivery by: (1) injection or infusion which is intraarterial, intra- or transdermal, subcutaneous, intramuscular, intraspinal, intrathecal, or intravenous, wherein said active ingredient: (a) is contained in solution as a  
30 solute; (b) is contained in the discontinuous phase of an emulsion, or the discontinuous phase of an inverse emulsion which inverts upon injection or infusion, said emulsions containing suitable emulsifying agents; or (c) is contained in a suspension as a suspended solid in colloidal or microparticulate form, said suspension containing suitable suspending agents; (2) injection or infusion into suitable body tissues or cavities as a depot, wherein said composition  
35 provides storage of said active ingredient and thereafter delayed-, sustained-, and/or controlled-release of said active ingredient for systemic distribution; (3) instillation, inhalation

or insufflation into suitable body tissues or cavities of said pharmaceutical composition in suitable solid form, where said active ingredient: (a) is contained in a solid implant composition providing delayed-, sustained-, and/or controlled-release of said active ingredient; (b) is contained in a particulate composition to be inhaled into the lungs; or (c) is contained in a particulate composition to be blown into suitable body tissues or cavities, where said composition optionally provides delayed-, sustained-, and/or controlled-release of said active ingredient; or (4) ingestion of said pharmaceutical composition in suitable solid or liquid form for peroral delivery of said active ingredient, where said active ingredient is contained in a solid dosage form; or (b) is contained in a liquid dosage form.

Particular dosage forms of the above-described pharmaceutical compositions include (1) suppositories as a special type of implant, comprising bases which are solid at room temperature but melt at body temperature, slowly releasing the active ingredient with which they are impregnated into the surrounding tissue of the body, where the active ingredient becomes absorbed and transported to effect systemic administration; (2) solid peroral dosage forms selected from the group consisting of (a) delayed-release oral tablets, capsules, caplets, lozenges, troches, and multiparticulates; (b) enteric-coated tablets and capsules which prevent release and absorption in the stomach to facilitate delivery distal to the stomach of the patient being treated; (c) sustained-release oral tablets, capsules and microparticulates which provide systemic delivery of the active ingredient in a controlled manner up to a 24-hour period; (d) fast-dissolving tablets; (e) encapsulated solutions; (f) an oral paste; (g) a granular form incorporated in or to be incorporated in the food of a patient being treated; and (h) liquid peroral dosage forms selected from the group consisting of solutions, suspensions, emulsions, inverse emulsions, elixirs, extracts, tinctures, and concentrates.

Pharmaceutical compositions within the scope of the present invention include those wherein the therapeutically effective amount of an active ingredient comprising a compound of the present invention required for treating or preventing diseases, disorders, and conditions mediated by or associated with modulation of PDE4 activity as described herein is provided in a dosage form suitable for local administration to a patient being treated, wherein said pharmaceutical composition contains said active ingredient in suitable liquid form for delivering said active ingredient by: (1) injection or infusion into a local site which is intraarterial, intraarticular, intrachondrial, intracostal, intracystic, intra- or transdermal, intrafascicular, intraligamentous, intramedullary, intramuscular, intranasal, intraneural, intraocular, i.e., ophthalmic administration, intraosteal, intrapelvic, intrapericardial, intraspinal, intrasternal, intrasynovial, intratarsal, or intrathecal; including components which provide delayed-release, controlled-release, and/or sustained-release of said active ingredient into said local site; where said active ingredient is contained: (a) in solution as a solute; (b) in the

discontinuous phase of an emulsion, or the discontinuous phase of an inverse emulsion which inverts upon injection or infusion, said emulsions containing suitable emulsifying agents; or (c) in a suspension as a suspended solid in colloidal or microparticulate form, said suspension containing suitable suspending agents; or (2) injection or infusion as a depot for delivering said active ingredient to said local site; wherein said composition provides storage of said active ingredient and thereafter delayed-, sustained-, and/or controlled-release of said active ingredient into said local site, and wherein said composition also includes components which ensure that said active ingredient has predominantly local activity, with little systemic carryover activity; or wherein said pharmaceutical composition contains said active ingredient in suitable solid form for delivering said inhibitor by: (3) instillation, inhalation or insufflation to said local site, where said active ingredient is contained: (a) in a solid implant composition which is installed in said local site, said composition optionally providing delayed-, sustained-, and/or controlled-release of said active ingredient to said local site; (b) in a particulate composition which is inhaled into a local site comprising the lungs; or (c) in a particulate composition which is blown into a local site, where said composition includes components which will ensure that said active ingredient has predominantly local activity, with insignificant systemic carryover activity, and optionally provides delayed-, sustained-, and/or controlled-release of said active ingredient to said local site. For ophthalmic use, the pharmaceutical compositions may be formulated as micronized suspension in isotonic, pH adjusted sterile saline, or, preferably, as solutions in isotonic, pH adjusted sterile saline, either with or without a preservative such as benzylalkonium chloride. Alternatively, for ophthalmic uses, the pharmaceutical compositions may be formulated in an ointment such as petrolatum.

The pharmaceutical compositions of the present invention may also be administered by nasal aerosol or inhalation through the use of a nebulizer, a dry powder inhaler or a metered dose inhaler. Such compositions are prepared according to techniques well-known in the art of pharmaceutical formulation and may be prepared as solutions in saline, employing benzyl alcohol or other suitable preservatives, absorption promoters to enhance bioavailability, hydrofluorocarbons, and/or other conventional solubilizing or dispersing agents.

As already mentioned, the active ingredients of Formula (1.0.0) of the present invention may be administered systemically to a patient to be treated as a pharmaceutical composition in suitable liquid form by injection or infusion. There are a number of sites and organ systems in the body of the patient which will allow the properly formulated pharmaceutical composition, once injected or infused, to permeate the entire body and all of the organ system of the patient being treated. An injection is a single dose of the pharmaceutical composition forced, usually by a syringe, into the tissue involved. The most common types of injections are intramuscular, intravenous, and subcutaneous. By contrast,

an infusion is the gradual introduction of the pharmaceutical composition into the tissue involved. The most common type of infusion is intravenous. Other types of injection or infusion comprise intraarterial, intra- or transdermal (including subcutaneous), or intraspinal especially intrathecal. In these liquid pharmaceutical compositions, the active ingredient may be contained in solution as the solute. This is the most common and most preferred type of such composition, but requires an active ingredient in a salt form that has reasonably good aqueous solubility. Water (or saline) is by far the most preferred solvent for such compositions. Occasionally supersaturated solutions may be utilized, but these present stability problems that make them impractical for use on an everyday basis.

10 If it is not possible to obtain a form of some compound of Formula (1.0.0) that has the requisite degree of aqueous solubility, as may sometimes occur, it is within the skill of the artisan to prepare an emulsion, which is a dispersion of small globules of one liquid, the discontinuous or internal phase, throughout a second liquid, the continuous or external phase, with which it is immiscible. The two liquids are maintained in an emulsified state by the use of  
15 emulsifiers which are pharmaceutically acceptable. Thus, if the active ingredient is a water-insoluble oil, it can be administered in an emulsion of which it is the discontinuous phase. Also where the active ingredient is water-insoluble but can be dissolved in a solvent which is immiscible with water, an emulsion can be used. While the active ingredient would most commonly be used as the discontinuous or internal phase of what is referred to as an oil-in-  
20 water emulsion, it could also be used as the discontinuous or internal phase of an inverse emulsion, which is commonly referred to as a water-in-oil emulsion. Here the active ingredient is soluble in water and could be administered as a simple aqueous solution. However, inverse emulsions invert upon injection or infusion into an aqueous medium such as the blood, and offer the advantage of providing a more rapid and efficient dispersion of the  
25 active ingredient into that aqueous medium than can be obtained using an aqueous solution. Inverse emulsions are prepared by using suitable, pharmaceutically acceptable emulsifying agents well known in the art. Where the active ingredient has limited water solubility, it may also be administered as a suspended solid in colloidal or microparticulate form in a suspension prepared using suitable, pharmaceutically acceptable suspending agents. The  
30 suspended solids containing the active ingredient may also be formulated as delayed-, sustained-, and/or controlled-release compositions.

While systemic administration will most frequently be carried out by injection or infusion of a liquid, there are many situations in which it will be advantageous or even necessary to deliver the active ingredient as a solid. Systemic administration of solids is  
35 carried out by instillation, inhalation or insufflation of a pharmaceutical composition in suitable solid form containing the active ingredient. Instillation of the active ingredient may entail installing a solid implant composition into suitable body tissues or cavities. The implant may

- 145 -

comprise a matrix of bio-compatible and bio-erodible materials in which particles of a solid active ingredient are dispersed, or in which, possibly, globules or isolated cells of a liquid active ingredient are entrapped. Desirably, the matrix will be broken down and completely absorbed by the body. The composition of the matrix is also preferably selected to provide  
5 controlled-, sustained-, and/or delayed release of the active ingredient over extended periods of time, even as much as several months.

The term "implant" most often denotes a solid pharmaceutical composition containing the active ingredient, while the term "depot" usually implies a liquid pharmaceutical composition containing the active ingredient, which is deposited in any suitable body tissues  
10 or cavities to form a reservoir or pool which slowly migrates to surrounding tissues and organs and eventually becomes systemically distributed. However, these distinctions are not always rigidly adhered to in the art, and consequently, it is contemplated that there is included within the scope of the present invention liquid implants and solid depots, and even mixed solid and liquid forms for each. Suppositories may be regarded as a type of implant, since they  
15 comprise bases which are solid at room temperature but melt at a patient's body temperature, slowly releasing the active ingredient with which they are impregnated into the surrounding tissue of the patient's body, where the active ingredient becomes absorbed and transported to effect systemic administration.

Systemic administration can also be accomplished by inhalation or insufflation of a  
20 powder, i.e., particulate composition containing the active ingredient. For example, the active ingredient in powder form may be inhaled into the lungs using conventional devices for aerosolizing particulate formulations. The active ingredient as a particulate formulation may also be administered by insufflation, i.e., blown or otherwise dispersed into suitable body tissues or cavities by simple dusting or using conventional devices for aerosolizing particulate  
25 formulations. These particulate compositions may also be formulated to provide delayed-, sustained-, and/or controlled-release of the active ingredient in accordance with well understood principles and known materials.

Other means of systemic administration which may utilize the active ingredients of the present invention in either liquid or solid form include transdermal, intranasal, and ophthalmic  
30 routes. In particular, transdermal patches prepared in accordance with well known drug delivery technology may be prepared and applied to the skin of a patient to be treated, whereafter the active agent by reason of its formulated solubility characteristics migrates across the epidermis and into the dermal layers of the patient's skin where it is taken up as part of the general circulation of the patient, ultimately providing systemic distribution of the  
35 active ingredient over a desired, extended period of time. Also included are implants which are placed beneath the epidermal layer of the skin, i.e. between the epidermis and the dermis

of the skin of the patient being treated. Such an implant will be formulated in accordance with well known principles and materials commonly used in this delivery technology, and may be prepared in such a way as to provide controlled-, sustained-, and/or delayed-release of the active ingredient into the systemic circulation of the patient. Such subepidermal (subcuticular) implants provide the same facility of installation and delivery efficiency as transdermal patches, but without the limitation of being subject to degradation, damage or accidental removal as a consequence of being exposed on the top layer of the patient's skin.

In the above description of pharmaceutical compositions containing an active ingredient of Formula (1.0.0), the equivalent expressions: "administration", "administration of", "administering", and "administering a" have been used with respect to said pharmaceutical compositions. As thus employed, these expressions are intended to mean providing to a patient in need of treatment a pharmaceutical composition of the present invention by any of the routes of administration herein described, wherein the active ingredient is a compound of Formula (1.0.0) or a prodrug, derivative, or metabolite thereof which is useful in treating a disease, disorder, or condition mediated by or associated with modulation of PDE4 activity in said patient. Accordingly, there is included within the scope of the present invention any other compound which, upon administration to a patient, is capable of directly or indirectly providing a compound of Formula (1.0.0). Such compounds are recognized as prodrugs, and a number of established procedures are available for preparing such prodrug forms of the compounds of Formula (1.0.0).

The dosage and dose rate of the compounds of Formula (1.0.0) effective for treating or preventing a disease, disorder, or condition mediated by or associated with modulation of PDE4 activity, will depend on a variety of factors, such as the nature of the inhibitor, the size of the patient, the goal of the treatment, the nature of the pathology to be treated, the specific pharmaceutical composition used, and the observations and conclusions of the treating physician.

For example, where the dosage form is oral, e.g., a tablet or capsule, suitable dosage levels of the compounds of Formula (1.0.0) will be between about 0.1  $\mu\text{g/kg}$  and about 50.0  $\text{mg/kg}$  of body weight per day, preferably between about 5.0  $\mu\text{g/kg}$  and about 5.0  $\text{mg/kg}$  of body weight per day, more preferably between about 10.0  $\mu\text{g/kg}$  and about 1.0  $\text{mg/kg}$  of body weight per day, and most preferably between about 20.0  $\mu\text{g/kg}$  and about 0.5  $\text{mg/kg}$  of body weight per day of the active ingredient.

Where the dosage form is topically administered to the bronchia and lungs, e.g., by means of a powder inhaler or nebulizer, suitable dosage levels of the compounds of Formula (1.0.0) will be between about 0.001  $\mu\text{g/kg}$  and about 10.0  $\text{mg/kg}$  of body weight per day, preferably between about 0.5  $\mu\text{g/kg}$  and about 0.5  $\text{mg/kg}$  of body weight per day, more

- 147 -

preferably between about 1.0 µg/kg and about 0.1 mg/kg of body weight per day, and most preferably between about 2.0 µg/kg and about 0.05 mg/kg of body weight per day of the active ingredient.

Using representative body weights of 10 kg and 100 kg in order to illustrate the range of daily oral dosages which might be used as described above, suitable dosage levels of the compounds of Formula (1.0.0) will be between about 1.0 - 10.0 µg and 500.0 - 5000.0 mg per day, preferably between about 50.0 - 500.0 µg and 50.0 - 500.0 mg per day, more preferably between about 100.0 - 1000.0 µg and 10.0 - 100.0 mg per day, and most preferably between about 200.0 - 2000.0 µg and about 5.0 - 50.0 mg per day of the active ingredient comprising a compound of Formula (1.0.0). These ranges of dosage amounts represent total dosage amounts of the active ingredient per day for a given patient. The number of times per day that a dose is administered will depend upon such pharmacological and pharmacokinetic factors as the half-life of the active ingredient, which reflects its rate of catabolism and clearance, as well as the minimal and optimal blood plasma or other body fluid levels of said active ingredient attained in the patient which are required for therapeutic efficacy

Numerous other factors must also be considered in deciding upon the number of doses per day and the amount of active ingredient per dose that will be administered. Not the least important of such other factors is the individual response of the patient being treated. Thus, for example, where the active ingredient is used to treat or prevent asthma, and is administered topically via aerosol inhalation into the lungs, from one to four doses consisting of actuations of a dispensing device, i.e., "puffs" of an inhaler, will be administered each day, each dose containing from about 50.0 µg to about 10.0 mg of active ingredient.

## DETAILED DESCRIPTION OF THE INVENTION

### 11.0 Preparations and Working Examples

#### Preparation 1

2-[Benzo[2,1,3]oxadiazol-5-yloxy]-nicotinic acid ethyl ester of Formula (5.0.1):

(5.0.1)

A mixture of 5.5 g (29.4 mmol) 2-chloro nicotinic acid ethyl ester, 4.0 g (29.4 mmol) 5-hydroxybenzofurazan and 20.1 g (61.7 mmol) cesium carbonate in 125 ml dry

dimethylformamide was heated at 90°C for five days. The mixture was poured into water and extracted with ethyl acetate. The ethyl acetate extracts were combined; washed successively with sodium bicarbonate solution, water, and brine; then dried (Na<sub>2</sub>SO<sub>4</sub>); and concentrated *in vacuo* to give a solid. Recrystallization from diethyl ether/pentane gave 2.2 g (26%) solid.

5 <sup>1</sup>H-NMR (CDCl<sub>3</sub>): δ 8.3 (m, 2H), 7.8 (d, 1H, J=10 Hz), 7.2 (m, 3H), 4.4 (q, 2H, J=7 Hz), 1.4 (t, 3H, J=7 Hz).

GC-MS (m/z): 285 (M<sup>+</sup>, 20), 122 (100).

### Preparation 2

10

2-[Benzo[2,1,3]oxadiazol-5-yloxy]-nicotinic acid of Formula (5.0.2):

(5.0.2)

15 A mixture of 2.2 g (7.7 mmol) 2-[benzo[2,1,3]oxadiazol-5-yloxy]-nicotinic acid ethyl ester and 23.1 ml (23.1 mmol) 1M LiOH in 75 ml tetrahydrofuran was stirred overnight at room temperature. The tetrahydrofuran was evaporated *in vacuo* and the aqueous mixture was then acidified with 1N HCl. The resulting precipitate was filtered and dried to give 1.9 g (96%) solid.

20 <sup>1</sup>H-NMR (CH<sub>3</sub>OD): δ 8.4 (d, 1H, J=8 Hz), 8.3 (dd, 1H, J=2, 5 Hz), 8.0 (d, 1H, J=9 Hz), 7.6 (s, 1H), 7.5 (d, 1H, J=9 Hz), 7.2 (dd, 1H, 5, 8 Hz).

MS (m/z): 257 (M<sup>+</sup>, 20), 256 (100).

### Preparation 3

25

2-[Benzo[2,1,3]oxadiazol-5-yloxy]-N-[4-[2-methyl-[1,3]dioxolan-2-yl]-benzyl]-nicotinamide of Formula (5.0.3):

- 149 -

(5.0.3)

Prepared in a manner analogous to Example 1 substituting 4-[2-methyl-[1,3]dioxolan-2-yl]-benzylamine (Korytnyk, *et. al.*, *J. Med. Chem.* 21 507, 1978).

- 5 <sup>1</sup>H-NMR (CDCl<sub>3</sub>): δ 8.6 (dd, 1H, J=2, 8 Hz), 8.2 (dd, 1H, J= 2, 5 Hz), 7.8 (m, 1H), 7.5 (d, 1H, J=2 Hz), 7.4 (m, 2H), 7.3 (m, 5H), 4.7 (d, 2H, J=6 Hz), 4.0 (m, 2H), 3.7 (m, 2H), 1.6 (s, 3H).

#### Preparation 4

- 10 (±)-1-[5-aminomethyl-thiophen-2-yl]-ethanol of Formula (5.0.4):

(5.0.4)

- 15 To a stirred solution of 400 mg (2.61 mmol) (±)-1-[5-cyano-thiophen-2-yl]-ethanol in 20 ml tetrahydrofuran at 0°C was added drop-wise 8 ml (8.10 mmol) 1.0M lithium aluminum hydride in tetrahydrofuran. The mixture was refluxed for 1 h., cooled to 0°C, then quenched with methanol added drop-wise. The mixture was diluted with chloroform and washed with water. The resulting emulsion was filtered through Celite and the filtrate layers separated. The organic extract was dried (MgSO<sub>4</sub>) then concentrated *in vacuo* to give 310 mg (76%) oil.

- 20 <sup>1</sup>H-NMR (CDCl<sub>3</sub>): δ 6.8 (m, 1H), 6.7 (m, 1H), 5.0 (q, 1H, J=6 Hz), 4.0 (s, 2H), 1.6 (d, 3H, J=6 Hz).

#### Preparation 5

(±)-1-[5-cyano-thiophen-2-yl]-ethanol of Formula (5.0.5):

- 150 -

(5.0.5)

To a stirred solution of 1.0 g (6.61 mmol) 2-acetyl-5-cyanothiophene in 20 ml methanol at 0°C was added 312 mg sodium borohydride. The mixture was stirred at 0°C for 1 h., then  
 5 quenched with saturated NH<sub>4</sub>Cl solution. The mixture was poured into water, and then extracted with ethyl acetate. The organic extracts were combined; washed successively with water and brine; then dried (MgSO<sub>4</sub>); and concentrated *in vacuo* to give an oil. Chromatography on silica gel eluting with ethyl acetate/hexanes (1:4) gave 900 mg (89%) oil.

<sup>1</sup>H-NMR (CDCl<sub>3</sub>): δ 7.5 (d, 1H, J=4 Hz), 6.9 (dd, 1H, J=1, 4 Hz), 5.1 (q, 1H, J=6 Hz), 1.6 (d,  
 10 1H, J=6 Hz).

#### Preparation 6

(±)-2-[4-[1-amino-ethyl]-3-fluoro-phenyl]-propan-2-ol of Formula (5.0.6):

(5.0.6)

A mixture of 158 mg (0.48 mmol) (±)-2-[1-[2-fluoro-4-[1-hydroxy-1-methyl-ethyl]-phenyl]-ethyl]-isoindole-1,3-dione and 0.08 ml (2.4 mmol) hydrazine hydrate in 10 ml methanol was stirred at room temperature overnight. The resulting precipitate was filtered and the filtrate  
 20 concentrated to give a solid. The solid was triturated with chloroform, filtered and the filtrate was then concentrated to give 110 mg (100%) oil.

<sup>1</sup>H-NMR (CDCl<sub>3</sub>): δ 7.2 (m, 3H), 4.3 (q, 1H, J=7 Hz), 1.5 (s, 6H), 1.4 (d, 3H, J=7 Hz).

#### Preparation 7

25

(±)-2-[1-[2-fluoro-4-[1-hydroxy-1-methyl-ethyl]-phenyl]-ethyl]-isoindole-1,3-dione of Formula (5.0.7):

- 151 -

(5.0.7)

To a stirred suspension of 311 mg (1.0 mmol) (±)-2-[1-[4-acetyl-2-fluoro-phenyl]-ethyl]-isoindole-1,3-dione and 296 mg (1.2 mmol) cerium (III) chloride in 20 ml dry tetrahydrofuran at 0°C, was added drop-wise 0.4 ml (1.2 mmol) 3.0 M methyl magnesium chloride in tetrahydrofuran. The mixture was allowed to come slowly to room temperature over 4 hrs.; poured into water; acidified with 2 N acetic acid; and then extracted with ethyl acetate. The organic extracts were combined; washed successively with water and brine; then dried; and concentrated *in vacuo* to give an oil. Chromatography on silica gel eluting with ethyl acetate/hexanes (1:2) gave 165 mg (50%) oil.

MS (m/z): 327 (M<sup>+</sup>, 100).

#### Preparation 8

(±)-2-[1-[4-acetyl-2-fluoro-phenyl]-ethyl]-isoindole-1,3-dione of Formula (5.0.8):

(5.0.8)

A mixture of 1.09 g (3.54 mmol) (±)-2-[1-[4-bromo-2-fluoro-phenyl]-ethyl]-isoindole-1,3-dione, 2.3 ml (17.7 mmol) butyl vinyl ether, 1.0 g (3.9 mmol) thallium (I) acetate, 1 ml (7.1 mmol) triethylamine, 80 mg (0.195 mmol) 1,3-bis(diphenylphosphinopropane), and 39 mg (0.18 mmol) palladium (II) acetate in 40 ml dry dimethylformamide was deaired under nitrogen and then heated at 90°C for 5 hrs. The mixture was poured into water, and then extracted with ethyl acetate. The organic extracts were combined; washed successively with water and brine; then dried (MgSO<sub>4</sub>); and concentrated to give an oil. The oil was taken up in 50 ml tetrahydrofuran, and 50 ml 1.0 N HCl was then added, whereafter the mixture was stirred at room temperature for 1 h. The mixture was poured into water, and then extracted with ethyl acetate. The organic extracts were combined; washed successively with water and brine;

then dried ( $\text{MgSO}_4$ ); and concentrated *in vacuo* to give an oil. Chromatography on silica gel eluting with ethyl acetate/hexanes (1:2) gave 330 mg (30%) solid.

$^1\text{H-NMR}$  ( $\text{CDCl}_3$ ):  $\delta$  7.7 (m, 6H), 7.5 (d, 1H,  $J=11$  Hz), 5.8 (q, 1H, 7 Hz), 2.5 (s, 3H), 1.9 (d, 3H,  $J=7$  Hz).

5

#### Preparation 9

( $\pm$ )-2-[1-[4-bromo-2-fluoro-phenyl]-ethyl]-isoindole-1,3-dione of Formula (5.0.9):

10

(5.0.9)

To a stirred solution of 1.2 g (5.5 mmol) ( $\pm$ )-1-[4-bromo-2-fluoro-phenyl]-ethanol, 886 mg (6.0 mmol) phthalimide and 1.6 g (6.0 mmol) triphenylphosphine in 20 ml dry THF at room temperature was added drop-wise, 1.0 ml (6.6 mmol) diethyl azodicarboxylate. The mixture was stirred at room temperature overnight, diluted with ethyl acetate and washed successively with water, brine then dried ( $\text{MgSO}_4$ ) and concentrated to give an oil. Chromatography on silica gel eluting with ethyl acetate/hexanes (1:4) gave 1.1 g (58%) solid.

15

MS ( $m/z$ ): 347/349 ( $M^+$ , 100).

#### Preparation 10

20

( $\pm$ )-1-[4-bromo-2-fluoro-phenyl]-ethanol of Formula (5.0.10):

(5.0.10)

To a stirred solution of 5.0 g (0.025 mol.) 4-bromo-2-fluorobenzaldehyde in 50 ml dry tetrahydrofuran at  $0^\circ\text{C}$  was added dropwise 10 ml 3.0M methyl magnesium chloride in tetrahydrofuran. The mixture was stirred at  $0^\circ\text{C}$  for 30 min., then stirred at room temperature for 2 hrs. The mixture was cooled to  $0^\circ\text{C}$  then quenched with methanol added dropwise. The mixture was poured into water, acidified with 1 N HCl, then extracted with ethyl acetate. The organic extracts were combined, washed successively with water, brine then dried ( $\text{MgSO}_4$ ) and concentrated *in vacuo* to give an oil. Chromatography on silica gel eluting with ethyl acetate/hexanes (1:4) gave 3.2 g (58%) oil.

30

<sup>1</sup>H-NMR (CDCl<sub>3</sub>): δ 7.3 (m, 3H), 5.1 (q, 1H, J=6Hz), 1.4 (d, 3H, J=6 Hz).

### Preparation 11

- 5 (R)-Diallyl-[1-(4-bromo-phenyl)-ethyl]-amine of Formula (5.0.11):

(5.0.11)

A mixture of 2.0 g (10.0 mmol) (R)-1-(4-bromo-phenyl)-ethylamine and 30 ml toluene (dry) was cooled to 0°C. Thereafter, 5.2 ml (30.0 mmol) of di-*iso*-propylethylamine was added drop-wise, followed by the addition of 7.4 ml (85 mmol) allyl bromide. The resulting mixture was warmed to room temperature and then heated to 95°C for 2.5 hours. The mixture was filtered. The precipitate was then washed with toluene and the filtrate and washings were combined and then concentrated *in vacuo* to give a reddish-brown oil. Chromatography on silica gel using 15% ethyl acetate/hexanes gave 2.76 g (99%) oil.

- 15 <sup>1</sup>H-NMR (CDCl<sub>3</sub>): δ 7.40 (d, 2H, J=8Hz), 7.22 (d, 2H, J=8Hz), 5.79 (m, 2H), 5.10 (m, 4H), 3.83 (q, 1H, J=7Hz), 3.03 (m, 4H), 1.27 (d, 3H, J=7Hz).

### Preparation 12

- 20 (R)-2-[4-(1-Diallylamino-ethyl)-phenyl]-propan-2-ol of Formula (5.0.12):

(5.0.12)

- 2.76 g (9.9 mmol) (R)-diallyl-[1-(4-bromo-phenyl)-ethyl]-amine was dissolved in 30 ml THF (dry) under N<sub>2</sub> atmosphere. The mixture was then cooled to -78°C and 5.0 ml (12 mmol) of 2.5M *n*-BuLi in hexanes was added drop-wise. The mixture was then cooled to -90°C and acetone was added, while stirring continued at -90°C for 10 m. The mixture was then allowed to warm to room temperature and the reaction was thereafter quenched with MeOH. Water was then added and the resulting mixture was extracted with ether. The ether extracts were combined; washed with water and brine; dried over MgSO<sub>4</sub>; and filtered and

concentrated *in vacuo*. Chromatography on silica gel using 15% ethyl acetate/hexanes yielded 1.6 g (64%) of the desired final product.

$^1\text{H-NMR}$  ( $\text{CDCl}_3$ ):  $\delta$  7.35 (d, 2H,  $J=8\text{Hz}$ ), 7.23 (d, 2H,  $J=8\text{Hz}$ ), 5.76 (m, 2H), 5.09 (m, 4H), 3.82 (q, 1H,  $J=7\text{Hz}$ ), 3.00 (m, 4H), 1.48 (s, 6H), 1.27 (d, 3H,  $J=7\text{Hz}$ ).

5 MS ( $m/z$ ) 260 ( $M^+ +1$ , 100).

### Preparation 13

(R)-2-[4-(1-Amino-ethyl)-phenyl]-propan-2-ol of Formula (5.0.13):

10

(5.0.13)

A mixture of 0.63 g (0.54 mmol)  $\text{Pd}(\text{PPh}_3)_4$  and 25.3 g (162 mmol) NDMBA was combined and placed under  $\text{N}_2$ . Thereafter, a solution of 7.0 g (27 mmol) (R)-2-[4-(1-diallylamino-ethyl)-phenyl]-propan-2-ol in 140 ml  $\text{CH}_2\text{Cl}_2$  was added. The resulting mixture was then refluxed under  $\text{N}_2$  for 2 hours. The crude reaction mixture was then loaded onto coarse silica gel. Chromatography on silica gel using 7.5% MeOH/ $\text{CH}_2\text{Cl}_2$  followed by 2%  $\text{NH}_4\text{OH}$ / 10% MeOH/ $\text{CH}_2\text{Cl}_2$  yielded 4.5 g (93%) of the desired product.

15

$^1\text{H-NMR}$  ( $\text{CDCl}_3$ ):  $\delta$  7.39 (d, 2H,  $J=8\text{Hz}$ ), 7.26 (d, 2H,  $J=8\text{Hz}$ ), 4.11 (q, 1H,  $J=7\text{Hz}$ ), 1.52 (s, 6H), 1.42 (d, 3H,  $J=7\text{Hz}$ ).

20

### Preparation 14

(S)-Diallyl-[1-(4-bromo-phenyl)-ethyl]-amine of Formula (5.0.14):

25

(5.0.14)

Prepared in an analogous manner to Preparation 11 substituting (S)-1-(4-bromo-phenyl)-ethylamine.

<sup>1</sup>H-NMR (CDCl<sub>3</sub>): δ 7.40 (d, 2H, J=8Hz), 7.22 (d, 2H, J=8Hz), 5.79 (m, 2H), 5.10 (m, 4H), 3.83 (q, 1H, J=7Hz), 3.03 (m, 4H), 1.27 (d, 3H, J=7Hz).

### Preparation 15

5

(S)-2-[4-(1-Diallylamino-ethyl)-phenyl]-propan-2-ol of Formula (5.0.15):

(5.0.15)

10 Prepared in an analogous manner to Preparation 12 substituting (S)-diallyl-[1-(4-bromophenyl)-ethyl]-amine.

<sup>1</sup>H-NMR (CDCl<sub>3</sub>): δ 7.35 (d, 2H, J=8Hz), 7.23 (d, 2H, J=8Hz), 5.76 (m, 2H), 5.09 (m, 4H), 3.82 (q, 1H, J=7Hz), 3.00 (m, 4H), 1.48 (s, 6H), 1.27 (d, 3H, J=7Hz).

MS (m/z) 260 (M<sup>+</sup> +1, 100).

### 15 Preparation 16

(S)-2-[4-(1-Amino-ethyl)-phenyl]-propan-2-ol of Formula (5.0.16):

(5.0.16)

20 Prepared in an analogous manner to Preparation 13 substituting (S)-2-[4-(1-diallylamino-ethyl)-phenyl]-propan-2-ol.

<sup>1</sup>H-NMR (CDCl<sub>3</sub>): δ 7.39 (d, 2H, J=8Hz), 7.26 (d, 2H, J=8Hz), 4.11 (q, 1H, J=7Hz), 1.52 (s, 6H), 1.42 (d, 3H, J=7Hz).

### 25 Preparation 17

(S)-2-[4-(1-Hydroxy-1-methyl-ethyl)-cyclohex-1-enylmethyl]-isoindole-1,3-dione of Formula (5.0.17):

- 156 -

(5.0.17)

A mixture of 2.2 g (16 mmol)  $K_2CO_3$ , 1.2 g (8.4 mmol) phthalimide, and 40 ml DMF was stirred at room temperature for 0.5 hours. Thereafter, 1.7 g (7.4 mmol) (S)-2-(4-bromomethyl-cyclohex-3-enyl)-propan-2-ol (Bull, et. al. *Aust. J. Chem.*, 46 1869, 1993) was added and the resulting mixture was stirred at room temperature for 72 h. Water was added and the mixture was then extracted with ethyl acetate. The ethyl acetate extracts were combined; washed with water and brine; dried ( $MgSO_4$ ); and filtered and concentrated *in vacuo*. Chromatography on silica gel using 20% ethyl acetate/hexanes yielded 0.62 g (28%) of the desired product.

MS (m/z) 300 ( $M^+ + 1, 5$ ), 282 (100).

#### Preparation 18

(S)-2-(4-Aminomethyl-cyclohex-3-enyl)-propan-2-ol of Formula (5.0.18):

(5.0.18)

A mixture of 0.62 g (2.1 mmol) (S)-2-[4-(1-hydroxy-1-methyl-ethyl)-cyclohex-1-enyl-methyl]-isoindole-1,3-dione and 20 ml MeOH was cooled to 0°C. Thereafter, 0.2 ml (6 mmol) hydrazine hydrate was added and the resulting mixture was allowed to warm to room temperature and stirred overnight. The reaction mixture was then concentrated *in vacuo*; triturated with  $CHCl_3$ ; filtered and then concentrated to a filtrate yielding 0.31 g (63%) solid product.

MS (m/z) 211 (100), 170 ( $M^+ + 1, 55$ ).

#### Preparation 19

(R)-2-[4-(1-Hydroxy-1-methyl-ethyl)-cyclohex-1-enylmethyl]-isoindole-1,3-dione of Formula (5.0.19):

- 157 -

(5.0.19)

Prepared in an analogous manner to Preparation 17 substituting (R)-2-(4-bromomethyl-cyclohex-3-enyl)-propan-2-ol. (Bull, *et. al.*, *Ibid.*)

5 MS (m/z) 300 ( $M^+ + 1,5$ ), 282 (100).

#### Preparation 20

(R)-2-(4-Aminomethyl-cyclohex-3-enyl)-propan-2-ol of Formula (5.0.20):

10

(5.0.20)

Prepared in an analogous manner to Preparation 18 substituting (R)-2-[4-(1-hydroxy-1-methyl-ethyl)-cyclohex-1-enylmethyl]-isoindole-1,3-dione.

MS (m/z) 211 (100), 170 ( $M^+ + 1$ , 55).

15

#### Preparation 21

4-(1-Hydroxy-cyclopropyl)-benzonitrile of Formula (5.0.21):

20

(5.0.21)

A solution of di-*iso*-propylamine 2.9 ml (2.67 mmol) was dissolved in anhydrous THF 5.0 ml, cooled to  $-78^\circ\text{C}$ , and treated with 8.26 ml *n*-BuLi (2.5 M, 20.67 mmol). After stirring at  $-78^\circ\text{C}$  for 0.5 h, a solution of 2.0 g (13.78 mmol) 4-acetyl-benzonitrile in 10 ml of anhydrous THF was added via syringe at  $-78^\circ\text{C}$ , followed by addition of 8.37 g (0.1 M, 20.7 mmol) samarium diiodide in THF. The reaction mixture was then stirred at  $-78^\circ\text{C}$  for 10 min, whereafter 10.95 g (41.34 mmol) diiodomethane was added and the reaction mixture was stirred 16 h, allowing

25

- 158 -

the reaction mixture to come to room temperature. The reaction mixture was quenched with 1N HCl, the THF was removed *in vacuo*, and extracted with EtOAc. Combined extracts were washed with brine and dried (Na<sub>2</sub>SO<sub>4</sub>), and concentrated *in vacuo* to give a black oil. Chromatography on silica gel with ethyl acetate/hexanes (1:4) afforded 0.57 g (26%) of a pale yellow solid.

<sup>1</sup>H NMR (CDCl<sub>3</sub>): δ 7.57 (d, 2H, J= 9 Hz), 7.30 (d, 2H, J= 9 Hz), 1.37 (m, 2H), 1.09 (m, 2H).

#### Preparation 22

1-(4-Aminomethyl-phenyl)-cyclopropanol of Formula (5.0.22):

(5.0.22)

Prepared in a manner analogous to Preparation 4 substituting 4-(1-Hydroxy-cyclopropyl)-benzonitrile.

<sup>1</sup>H-NMR (CDCl<sub>3</sub>): δ 7.25 (m, 4H), 3.83 (s, 2H), 1.78 (br, 2H), 1.24 (m, 2H), 1.01 (m, 2H).

#### Preparation 23

4-Acetyl-2-fluoro-benzonitrile of Formula (5.0.23):

(5.0.23)

Prepared in a manner analogous to Preparation 10 substituting 4-cyano-3-fluoro-benzoic acid methyl ester.

<sup>1</sup>H NMR (CDCl<sub>3</sub>): δ 7.78 (m, 3H), 2.61 (s, 3H).

#### Preparation 24

2-Fluoro-4-(1-hydroxy-cyclopropyl)-benzonitrile of Formula (5.0.24):

- 159 -

(5.0.24)

Prepared in a manner analogous to Preparation 21 substituting 4-acetyl-2-fluoro-benzonitrile.

<sup>1</sup>H NMR (CDCl<sub>3</sub>): δ 7.50 (m, 1H), 7.15 (d, 1H, J = 10 Hz), 7.01 (d, 1H, J = 8 Hz), 2.60 (s, 1H),  
 5 1.42 (m, 2H), 1.11 (m, 2H).

#### Preparation 25

1-(4-Aminomethyl-3-fluoro-phenyl)-cyclopropanol of Formula (5.0.25):

(5.0.25)

Prepared in a manner analogous to Preparation 4 substituting 2-fluoro-4-(1-hydroxy-cyclopropyl)-benzonitrile.

<sup>1</sup>H NMR (CDCl<sub>3</sub>): δ 7.23 (m, 1H), 7.18 (m, 2H), 3.81 (s, 2H), 1.22 (m, 2H), 0.95 (m, 2H).

#### Preparation 26

(±)-Diallyl-[1-(4-bromo-phenyl)-ethyl]-amine of Formula (5.0.26):

(5.0.26)

Prepared in an analogous manner to Preparation 11 substituting (+/-)-1-(4-Bromo-phenyl)-ethylamine.

<sup>1</sup>H-NMR (CDCl<sub>3</sub>): δ 7.40 (d, 2H, J=8Hz), 7.22 (d, 2H, J=8Hz), 5.79 (m, 2H), 5.10 (m, 4H), 3.83 (q, 1H, J=7Hz), 3.03 (m, 4H), 1.27 (d, 3H, J=7Hz).

#### Preparation 27

5

(±)-2-[4-(1-Diallylamino-ethyl)-phenyl]-propan-2-ol of Formula (5.0.27):

(5.0.27)

Prepared in an analogous manner to Preparation 12 substituting (+/-)-Diallyl-[1-(4-bromo-phenyl)-ethyl]-amine.

10

<sup>1</sup>H-NMR (CDCl<sub>3</sub>): δ 7.35 (d, 2H, J=8Hz), 7.23 (d, 2H, J=8Hz), 5.76 (m, 2H), 5.09 (m, 4H), 3.82 (q, 1H, J=7Hz), 3.00 (m, 4H), 1.48 (s, 6H), 1.27 (d, 3H, J=7Hz).

#### Preparation 28

15

(±)-2-[4-(1-Amino-ethyl)-phenyl]-propan-2-ol of Formula (5.0.28):

(5.0.28)

Prepared in an analogous manner to Preparation 13 substituting (+/-)- 2-[4-(1-Diallylamino-ethyl)-phenyl]-propan-2-ol.

20

<sup>1</sup>H-NMR (CDCl<sub>3</sub>): δ 7.39 (d, 2H, J=8Hz), 7.26 (d, 2H, J=8Hz), 4.11 (q, 1H, J=7Hz), 1.52 (s, 6H), 1.42 (d, 3H, J=7Hz).

#### Preparation 29

25

Benzo-[2,1,3]-thiadiazol-5-ol of Formula (5.0.29):

- 161 -

(5.0.29)

5-Methoxy-benzo-[2,1,3]-thiadiazole (4.09 g, 24.6 mmol) was stirred with hydrobromic acid (60 ml, 165 mmol, 30% in acetic acid) at 80 °C for 5 days. The mixture was cooled to 10 °C and filtered. The solids were purified by short column chromatography (50% ethyl acetate/hexane). Solvents were stripped *in vacuo* to afford 1.0 g of a yellow solid (27% yield).

<sup>1</sup>H NMR (CD<sub>3</sub>OD): δ 7.81 (d, 1H, J = 2 Hz), 7.79 (d, 1H, J = 2 Hz), 7.30 (s, 1H).

#### Preparation 30

10

2-(Benzo-[2,1,3]-thiadiazol-5-yloxy)-nicotinic acid ethyl ester of Formula (5.0.30):

(5.0.30)

15 A mixture of 2-chloro-nicotinic acid ethyl ester (0.516 g, 3 mmol), benzo-[2,1,3]-thiadiazol-5-ol (0.46 g, 3 mmol), and cesium carbonate (2.07 g, 6.3 mmol) was stirred in 40 ml *N,N*-dimethylformamide at 80 °C for 48 h. The dark orange mixture was cooled and poured into water (600 ml) and extracted with ethyl acetate. The combined organic layers were washed with water and brine, and dried over (Na<sub>2</sub>SO<sub>4</sub>). The mixture was concentrated *in vacuo* to give 0.74 g of a yellow solid (82 % yield).

MS (m/z): 302 (M<sup>+</sup>, 20), 227 (100).

#### Preparation 31

25

2-(Benzo-[2,1,3]-thiadiazol-5-yloxy)-nicotinic acid of Formula (5.0.31):

- 162 -

(5.0.31)

A solution of 2-(benzo[2,1,3]thiadiazol-5-yloxy)-nicotinic acid ethyl ester (0.74 g, 2.5 mmol) in tetrahydrofuran (2.78 ml) and 1 M LiOH (2.7 ml) was stirred over night. The mixture was  
 5 diluted with water and then acidified to pH 1 with 2 N hydrochloric acid, and thereafter filtered to give a pale yellow solid (160 mg).

<sup>1</sup>H NMR (CD<sub>3</sub>OD): δ 8.37 (d, 1H, J= 6 Hz), 8.26 (dd, 1H, J= 2 Hz, 5 Hz), 8.00 (d, 1H, J= 9 Hz), 7.60 (t, 1H, J= 2 Hz), 7.50 (t, 1H, J= 2 Hz), 7.26 (d, 1H, J= 8 Hz).

#### 10 Example 1

2-[Benzo[2,1,3]oxadiazol-5-yloxy]-N-[4-[1-hydroxy-1-methyl-ethyl]-benzyl]-nicotinamide of Formula (5.5.1):

(5.5.1)

15

To a stirred solution of 2.0 g (7.8 mmol) 2-[Benzo[2,1,3]oxadiazol-5-yloxy]-nicotinic acid, 1.3 g (7.8 mmol) 2-(4-aminomethyl-phenyl)-propan-2-ol and 1.2 g (8.6 mmol) 1-hydroxybenzotriazole hydrate (HOBt) in 200 ml DMF was added 1.8 g (9.3 mmol) 1-[3-(dimethylamino)propyl]-3-ethylcarbodiimide hydrochloride (EDCI) and the reaction mixture  
 20 was stirred overnight at room temperature. The mixture was poured into water and extracted with ethyl acetate. The ethyl acetate extracts were combined and washed successively with 1N NaOH, water, and brine; then dried (Na<sub>2</sub>SO<sub>4</sub>); and concentrated *in vacuo* to give a solid. Chromatography on silica gel eluting with ethyl acetate/hexanes (1:1) gave a solid. Recrystallization from ethyl acetate/hexanes afforded 2.1 g (68%) solid, mp 149-151°C.

- 163 -

$^1\text{H-NMR}$  ( $\text{CDCl}_3$ ):  $\delta$  8.6 (dd, 1H,  $J=2, 8$  Hz), 8.2 (dd, 1H,  $J=2, 5$  Hz), 7.8 (m, 2H), 7.5 (m, 2H), 7.2 (m, 5H), 4.7 (d, 2H,  $J=6$  Hz), 1.6 (s, 6H).

MS ( $m/z$ ): 405 ( $M^+$ , 5), 387 (100).

## 5 Example 2

2-[Benzo[2,1,3]oxadiazol-5-yloxy]-N-[2-fluoro-4-[1-hydroxy-1-methyl-ethyl]-benzyl]-nicotinamide of Formula (5.5.2):

(5.5.2)

Prepared in a manner analogous to Example 1 substituting 2-(4-aminomethyl-3-fluorophenyl)-propan-2-ol.

Mp 160-1°C.

MS ( $m/z$ ): 423 ( $M^++1$ , 25), 405 (100).

## Example 3

*Trans*-2-[Benzo[2,1,3]oxadiazol-5-yloxy]-N-[4-[1-hydroxy-1-methyl-ethyl]-cyclohexylmethyl]-nicotinamide of Formula (5.5.3):

(5.5.3)

Prepared in a manner analogous to Example 1 substituting 2-(4-aminomethyl-cyclohex-3-enyl)-propan-2-ol.

$^1\text{H-NMR}$  ( $\text{CDCl}_3$ ):  $\delta$  8.6 (dd, 1H,  $J=2, 8$  Hz), 8.2 (dd, 1H,  $J=2, 5$  Hz), 7.9 (d, 1H,  $J=10$  Hz), 7.6 (m, 2H), 7.3 (m, 4H), 3.4 (m, 3H), 1.9 (m, 4H), 1.6 (m, 2H), 1.2 (m, 10H).

- 164 -

MS (m/z): 410 ( $M^+$ , 30), 409 (100).**Example 4**

- 5 2-(Benzo[2,1,3]oxadiazol-5-yloxy)-N-[4-(1-hydroxy-cyclobutyl)-benzyl]-nicotinamide of Formula (5.5.4):

(5.5.4)

- 10 Prepared in a manner analogous to Example 1 substituting 2-(4-aminomethyl-phenyl)-cyclobutanol.

$^1\text{H-NMR}$  ( $\text{CDCl}_3$ ):  $\delta$  8.6 (ddd, 1H,  $J=2, 4, 8$  Hz), 8.2 (ddd, 1H, 2, 4, 5 Hz), 7.8 (m, 2H), 7.5 (m, 3H), 7.3 (m, 4H), 4.7 (d, 2H,  $J=6$  Hz), 2.5 (m, 2H), 2.1 (m, 2H), 2.0 (m, 1H), 1.7 (m, 1H).

MS (m/z): 417 ( $M^+ + 1$ , 20), 399 (100).15 **Example 5**

( $\pm$ )-2-[Benzo[2,1,3]oxadiazol-5-yloxy]-N-[4-[2,2,2-trifluoro-1-hydroxy-ethyl]-benzyl]-nicotinamide of Formula (5.5.5):

(5.5.5)

20

Prepared in a manner analogous to Example 1 substituting ( $\pm$ )-4-(2,2,2-trifluoro-ethoxy)-benzylamine.

Mp 164-6°C.

Anal. Calcd. For  $\text{C}_{21}\text{H}_{15}\text{N}_4\text{O}_4\text{F}_3$ : C, 56.76; H, 3.40; N, 12.61. Found: C, 56.66; H, 3.47; N, 12.51.

25

## Example 6

- 5 (±)-2-[Benzo[2,1,3]oxadiazol-5-yloxy]-N-[5-[1-hydroxy-ethyl]-thiophen-2-ylmethyl]-nicotinamide of Formula (5.5.6):

(5.5.6)

Prepared in a manner analogous to Example 1 substituting (±)-1-[5-aminomethyl-thiophen-2-yl]-ethanol.

- 10 Mp 81-3°C.

Anal. Calcd. For  $C_{19}H_{16}N_4O_4S$ : C, 57.57; H, 4.07; N, 14.13. Found: C, 57.74; H, 4.00; N, 14.15.

## Example 7

- 15 N-[4-Acetyl-benzyl]-2-[benzo[2,1,3]oxadiazol-5-yloxy]-nicotinamide of Formula (5.5.7):

(5.5.7)

- 20 A mixture of 466 mg (1.08 mmol) of 2-[benzo[2,1,3]oxadiazol-5-yloxy]-N-[4-[2-methyl-[1,3]dioxolan-2-yl]-benzyl]-nicotinamide in 20 ml tetrahydrofuran and 10 ml 1.0N HCl was stirred at room temperature for 2 hrs. The mixture was then poured into water, neutralized, and thereafter extracted with ethyl acetate. The organic extracts were combined; washed successively with water and brine; then dried ( $MgSO_4$ ); and concentrated *in vacuo* to give a

solid. Chromatography on silica gel eluting with ethyl acetate/hexanes (2:1) yielded a solid. Recrystallization from ethyl acetate/hexanes afforded 340 mg (75%) solid.

Mp 154-6°C.

Anal. Calcd. For  $C_{21}H_{16}N_4O_4$ : C, 64.94; H, 4.15; N, 14.43. Found: C, 64.93; H, 4.11; N, 14.52.

5

### Example 8

(±)-2-(Benzo[2,1,3]oxadiazol-5-yloxy)-N-{1-[2-fluoro-4-(1-hydroxy-1-methyl-ethyl)-phenyl]-ethyl}-nicotinamide of Formula (5.5.8):

10

(5.5.8)

Prepared in a manner analogous to Example 1 substituting (±)-2-[4-(1-amino-ethyl)-3-fluoro-phenyl]-propan-2-ol.

Mp 128-130°C.

15 Anal. Calcd. For  $C_{23}H_{21}N_4O_4F$ : C, 63.30; H, 4.85; N, 12.84. Found: C, 63.20; H, 4.88; N, 12.77.

### Example 9

20 2-(Benzo[2,1,3]oxadiazol-5-yloxy)-N-[2-chloro-4-(1-hydroxy-1-methyl-ethyl)-benzyl]-nicotinamide of Formula (5.5.9):

(5.5.9)

25 Prepared in a manner analogous to Example 1 substituting 2-(4-aminomethyl-3-chloro-phenyl)-propan-2-ol.

- 167 -

Mp 171-3°C.

MS (m/z) 439 ( $M^+ + 1$ , 5), 421 (100).**Example 10**

5

(±)-2-(Benzo[2,1,3]oxadiazol-5-yloxy)-N-[4-(1-hydroxy-ethyl)-benzyl]-nicotinamide of Formula (5.5.10):

(5.5.10)

- 10 Prepared in a manner analogous to Example 1 substituting 1-(4-aminomethyl-phenyl)-ethanol.

$^1\text{H-NMR}$  ( $\text{CDCl}_3$ ):  $\delta$  8.65 (dd, 1H,  $J=2$  Hz, 8 Hz), 8.21 (dd, 1H,  $J=2$  Hz, 5 Hz), 7.84 (m, 2H), 7.51 (m, 1H), 7.28 (m, 5H), 4.87 (q, 1H,  $J=6$  Hz), 4.70 (d, 2H,  $J=6$  Hz), 1.45 (d, 3H,  $J=6$  Hz).

MS (m/z): 391 ( $M^+ + 1$ , 5), 373 (100).

15

**Example 11**

(-)-2-(Benzo[2,1,3]oxadiazol-5-yloxy)-N-{1-[4-(1-hydroxy-1-methyl-ethyl)-phenyl]-ethyl}-nicotinamide of Formula (5.5.11):

(5.5.11)

20

Prepared in a manner analogous to Example 1 substituting (R)-2-[4-(1-amino-ethyl)-phenyl]-propan-2-ol.

<sup>1</sup>H-NMR (CDCl<sub>3</sub>): δ 8.57 (dd, 1H, J=2 Hz, 8 Hz), 8.18 (dd, 1H, J=2 Hz, 5 Hz), 7.84 (dd, 1H, J=1 Hz, 9 Hz), 7.51 (m, 1H), 7.41 (d, 2H, J=8 Hz), 7.30 (d, 2H, J=8 Hz), 7.22 (m, 2H), 5.31 (m, 1H), 1.56 (d, 3H, J=7 Hz), 1.51 (s, 6H).

MS (m/z): 417 (M<sup>+</sup> -1, 100).

5  $[\alpha]^{25}_D = -66.74^\circ$  (4.45, CHCl<sub>3</sub>).

### Example 12

10 (+)-2-(Benzo[2,1,3]oxadiazol-5-yloxy)-N-(1-[4-(1-hydroxy-1-methyl-ethyl)-phenyl]-ethyl)-nicotinamide of Formula (5.5.12):

(5.5.12)

Prepared in a manner analogous to Example 1 substituting (S)-2-[4-(1-amino-ethyl)-phenyl]-propan-2-ol.

15 <sup>1</sup>H-NMR (CDCl<sub>3</sub>): δ 8.57 (dd, 1H, J=2 Hz, 8 Hz), 8.18 (dd, 1H, J=2 Hz, 5 Hz), 7.84 (dd, 1H, J=1 Hz, 9 Hz), 7.51 (m, 1H), 7.41 (d, 2H, J=8 Hz), 7.30 (d, 2H, J=8 Hz), 7.22 (m, 2H), 5.31 (m, 1H), 1.56 (d, 3H, J=7 Hz), 1.51 (s, 6H).

MS (m/z): 417 (M<sup>+</sup> -1, 100).

$[\alpha]^{25}_D = +67.43^\circ$  (5.65, CHCl<sub>3</sub>).

20

### Example 13

(+)-2-(Benzo[2,1,3]oxadiazol-5-yloxy)-N-[4-(1-hydroxy-1-methyl-ethyl)-cyclohex-1-enylmethyl]-nicotinamide of Formula (5.5.13):

- 169 -

(5.5.13)

Prepared in a manner analogous to Example 1 substituting (R)-2-(4-aminomethyl-cyclohex-3-enyl)-propan-2-ol.

5 MS (m/z): 409 ( $M^+ + 1$ , 5), 391 (100).

$[\alpha]^{25}_D = + 0.45$  (0.013,  $\text{CHCl}_3$ ).

#### Example 14

10 (–)-2-(Benzo[2,1,3]oxadiazol-5-yloxy)-N-[4-(1-hydroxy-1-methyl-ethyl)-cyclohex-1-enylmethyl]-nicotinamide of Formula (5.5.14):

(5.5.14)

15 Prepared in a manner analogous to Example 1 substituting (S)-2-(4-aminomethyl-cyclohex-3-enyl)-propan-2-ol.

MS (m/z): 409 ( $M^+ + 1$ , 5), 391 (100).

$[\alpha]^{25}_D = - 1.01$  (0.0033,  $\text{CHCl}_3$ ).

#### Example 15

20 2-(Benzo[2,1,3]oxadiazol-5-yloxy)-N-[4-(1-hydroxy-cyclopropyl)-benzyl]-nicotinamide of Formula (5.5.15):

- 170 -

(5.5.15)

Prepared in a manner analogous to Example 1 substituting 1-(4-aminomethyl-phenyl)-cyclopropanol.

- 5 <sup>1</sup>H NMR (*d*<sub>6</sub>-DMSO): δ 8.94 (s, 1H), 8.24 (m, 1H), 8.13 (d, 1H, J=7 Hz), 8.09 (d, 1H, J=9 Hz), 7.47 (d, 1H, J=2 Hz), 7.31 (t, 1H, J=5 Hz), 7.20 (d, 2H J=8 Hz), 7.09 (d, 2H, J= 8 Hz), 5.83 (s, 1H), 4.42 (d, 2H, J=5 Hz), 1.01 (m, 2H), 0.82 (m, 2H).

MS (m/z): 402 (M<sup>+</sup>-1, 100).

#### 10 Example 16

2-(Benzo[2,1,3]oxadiazol-5-yloxy)-N-[2-fluoro-4-(1-hydroxy-cyclopropyl)-benzyl]-nicotinamide of Formula (5.5.16):

(5.5.16)

15

Prepared in a manner analogous to Example 1 substituting 1-(4-aminomethyl-3-fluoro-phenyl)-cyclopropanol.

- 15 <sup>1</sup>H NMR (CDCl<sub>3</sub>): δ 8.50 (d, 1H, J=8 Hz), 8.13 (m, 1H), 7.94 (m, 1H), 7.80 (d, 1H, J= 10 Hz), 7.48 (s, 1H), 7.24 (m, 1H), 7.17 (m, 1H), 6.95 (dd, 1H, J= 12 Hz, 2 Hz), 6.84 (dd, 1H, J= 12 Hz, 2 Hz), 4.61 (d, 2H, J= 6 Hz), 1.17 (d, 2H, J= 2 Hz), 0.87 (d, 2H, J= 2 Hz).

20

Mp 155-156 °C.

## Example 17

(±)-2-(Benzo[2,1,3]oxadiazol-5-yloxy)-N-{1-[4-(1-hydroxy-1-methyl-ethyl)-phenyl]-ethyl}-nicotinamide of Formula (5.5.17):

(5.5.17)

Prepared in a manner analogous to Example 1 substituting (+/-)-2-[4-(1-Amino-ethyl)-phenyl]-propan-2-ol.

<sup>1</sup>H-NMR (CDCl<sub>3</sub>): δ 8.57 (dd, 1H, J=2 Hz, 8 Hz), 8.18 (dd, 1H, J=2 Hz, 5 Hz), 7.84 (dd, 1H, J=1 Hz, 9 Hz), 7.51 (m, 1H), 7.41 (d, 2H, J=8 Hz), 7.30 (d, 2H, J=8 Hz), 7.22 (m, 2H), 5.31 (m, 1H), 1.56 (d, 3H, J=7 Hz), 1.51 (s, 6H). MS (m/z): 417 (M<sup>+</sup>-1, 100).

Mp 116-117 °C.

## Example 18

(±)-2-(Benzo[2,1,3]oxadiazol-5-yloxy)-N-[4-(1-hydroxy-1,2,2-trimethyl-propyl)-benzyl]-nicotinamide of Formula (5.5.18):

(5.5.18)

5.0 g (34.4 mmol) of 4-acetyl-benzonitrile was dissolved in dry THF and was then added to a solution of 60 ml dry THF and 21.0 ml of 2 M *t*-butyl magnesium chloride (41.2 mmol) at 0°C. The reaction mixture was stirred for 0.5 hours at 0°C and then quenched with 10 ml methanol. The mixture was then diluted with water and acidified using oxalic acid. The mixture was thereafter extracted with ether; the organic layers were combined; washed with water and

- 172 -

brine; then dried over  $\text{MgSO}_4$ ; filtered; and concentrated. Chromatography on silica gel using 20% ethyl acetate/hexanes yielded 2.60 g (37%) of crude product. The crude product (12.8 mmol) isolated after chromatography was then dissolved in dry THF and cooled to  $0^\circ\text{C}$ . Thereafter, 38.4 ml of 1.0 M  $\text{LiAlH}_4$  (38.4 mmol) was added dropwise and the reaction mixture was then warmed to room temperature and refluxed for 1 h. The mixture was then cooled to  $0^\circ\text{C}$  and 15 ml of methanol was added. The mixture was diluted with  $\text{CHCl}_3$  and water, and then filtered through celite and separated into layers. The organic layer was dried over  $\text{MgSO}_4$ , filtered, and concentrated. Crude product 0.76 g (3.67 mmol) was isolated. The crude product was then carried forward and the final product was prepared analogously to Example 1.

$^1\text{H-NMR}$  ( $\text{CDCl}_3$ ):  $\delta$  8.54 (dd, 1H,  $J=2$  Hz, 8 Hz), 8.20 (dd, 1H,  $J=2$  Hz, 5 Hz), 7.88 (m, 1H), 7.76 (d, 1H,  $J=6$  Hz), 7.45 (s, 1H), 7.35 (d, 2H,  $J=8$  Hz), 7.20 (m, 3H), 4.63 (d, 2H,  $J=5$  Hz), 1.50 (s, 3H), 0.82 (s, 9H).

MS ( $m/z$ ): 445 ( $M^+ - 1$ , 100).

#### Example 19

( $\pm$ )-2-(Benzo[2,1,3]oxadiazol-5-yloxy)-N-[4-(1-hydroxy-1,2-dimethyl-propyl)-benzyl]-nicotinamide of Formula (5.5.19):

(5.5.19)

Prepared in a manner analogous to Example 18 substituting *i*-propyl magnesium chloride.

$^1\text{H-NMR}$  ( $\text{CDCl}_3$ ):  $\delta$  8.64 (dd, 1H,  $J=2$  Hz, 8 Hz), 8.22 (dd, 1H,  $J=2$  Hz, 5 Hz), 7.82 (m, 2H), 7.52 (s, 1H), 7.22 (m, 5H), 4.69 (d, 2H,  $J=5$  Hz), 1.98 (m, 1H), 1.48 (s, 3H), 0.84 (d, 3H,  $J=7$  Hz), 0.75 (d, 3H,  $J=7$  Hz). MS ( $m/z$ ): 415 ( $M^+ - 18$ , 100).

#### Example 20

2-(Benzo[2,1,3]oxadiazol-5-yloxy)-N-[4-(1-cyano-1-methyl-ethyl)-benzyl]-nicotinamide of Formula (5.5.20):

- 173 -

(5.5.20)

- To a solution of 2-(benzo[2,1,3]oxadiazol-5-yloxy)-N-[4-(1-hydroxy-1-methyl-ethyl)-benzyl]-nicotinamide (300 mg, 0.74 mmol) in dichloromethane (1.5 ml) cooled to 0 °C was added trimethylsilyl cyanide (1 ml, 7.4 mmol) followed by slow addition of tin tetrachloride (7 drops of a 1.0 M solution in dichloromethane). The reaction mixture was allowed to warm to room temperature overnight. Potassium carbonate (300 mg, 2.10 mmol) and potassium fluoride dihydrate (120 mg, 2.10 mmol) were added, followed by dropwise addition of water. The reaction mixture was stirred vigorously for 90 m., after which silica gel was (600 mg) added.
- The mixture was filtered and washed thoroughly with dichloromethane. The filtrate was washed with saturated aqueous sodium bicarbonate, dried over magnesium sulfate, filtered and concentrated to give 124 mg of a pale yellow solid. Product was recrystallized from ethyl acetate/hexane to afford 96 mg (31% yield) of a pale yellow solid.

- <sup>1</sup>H NMR (CDCl<sub>3</sub>): δ 8.66 (dd, 1H, J = 2 Hz, 8 Hz), 8.22 (dd, 1H, J = 2 Hz, 4 Hz), 7.87 (dd, 2H, J = 1 Hz, 10 Hz), 7.55-7.19 (m, 6H), 4.72 (d, 2H, J = 6 Hz), 1.69 (s, 6H).

MS (m/z): 414 (M<sup>+</sup>+1, 100).

#### Example 21

- 2-(Benzo[2,1,3]thiadiazol-5-yloxy)-N-[4-(1-hydroxy-1-methyl-ethyl)-benzyl]-nicotinamide of Formula (5.5.21):

(5.5.21)

- 2-(Benzo[2,1,3]thiadiazol-5-yloxy)-nicotinic acid (30.8 mg, 0.11 mmol), 2-(4-aminomethyl-phenyl)-propan-2-ol (18.6 mg, 0.11 mmol), 1-hydroxybenzotriazole hydrate (16.8 mg, 0.12

- 174 -

mmol), and 1-[3-(dimethylamino)propyl]-3-ethylcarbodiimide hydrochloride (25.9 mg, 0.14 mmol) were dissolved in *N,N*-dimethylformamide (10 ml) and stirred at room temperature over night. The solution was poured into water (30 ml) and extracted with ethyl acetate. The combined organic layers were washed successively with 1N NaOH, water, and brine, then dried over sodium sulfate and concentrated *in vacuo*. The resulting amber oil was purified by flash column chromatography (1:1 ethyl acetate/hexane) to afford a white foam (29 mg, 0.07 mmol).

MS (*m/z*): 419 (*M*<sup>+</sup>, 100).

<sup>1</sup>H NMR (CDCl<sub>3</sub>): δ 8.66 (d, 1H, *J* = 8 Hz), 8.19 (dd, 1H, *J* = 5, 2 Hz), 7.99 (m, 2H), 7.70 (d, 1H, *J* = 2 Hz), 7.41 (m, 3H), 7.31 (d, 1H, *J* = 8 Hz), 7.23 (m, 1H), 4.70 (d, 2H, *J* = 5 Hz), 1.53 (s, 6H).

#### Example 22

2-(Benzo[2,1,3]thiadiazol-5-yloxy)-N-[2-fluoro-4-(1-hydroxy-1-methyl-ethyl)-benzyl]-nicotinamide of Formula (5.5.22):

(5.5.22)

Prepared in a manner analogous to Example 21, substituting 2-(4-aminomethyl-3-fluorophenyl)propan-2-ol. (66% yield.) m.p. = 124-125 °C.

<sup>1</sup>H NMR (CDCl<sub>3</sub>): δ 8.65 (d, 1H, *J* = 6 Hz), 8.21 (m, 2H), 8.03 (d, 1H, *J* = 10 Hz), 7.76 (s, 1H), 7.45 (d, 1H, *J* = 10 Hz), 7.39 (t, 1H, *J* = 8 Hz), 7.23 (d, 1H, *J* = 6 Hz), 7.20 (d, 1H, *J* = 10 Hz), 4.74 (d, 2H, *J* = 6 Hz), 1.53 (s, 6H).

WHAT IS CLAIMED IS:

1. A compound of Formula (1.0.0):

(1.0.0)

- wherein -

-m is 0, 1, or 2;

-n is 1 or 2;

10 -W is  $\text{—O—}$ ;  $\text{—S(=O)}_t\text{—}$ , where t is 0, 1, or 2; or  $\text{—N(R}^3\text{)—}$ , where  $\text{R}^3$  has the same meaning as defined below;

-Y is  $\text{=C(R}^E\text{)—}$ ; or  $\text{—[N=O)]—}$ ;

- where -

15  $\text{—R}^E$  is a member selected from the group consisting of  $\text{—H}$ ;  $\text{—F}$ ;  $\text{—Cl}$ ;  $\text{—CN}$ ;  $\text{—NO}_2$ ;  $\text{—(C}_1\text{—C}_4\text{) alkyl}$ ;  $\text{(C}_2\text{—C}_4\text{) alkynyl}$ ; fluorinated- $\text{(C}_1\text{—C}_3\text{) alkyl}$ ;  $\text{(C}_1\text{—C}_3\text{)alkoxy}$ ; fluorinated- $\text{(C}_1\text{—C}_3\text{) alkoxy}$ ;  $\text{—OH}$ ; and  $\text{—C(=O)NR}^{12}\text{R}^{13}$  where  $\text{R}^{12}$  and  $\text{R}^{13}$  are as defined below;

20  $\text{—R}^A$  and  $\text{R}^B$  are each a member independently selected from the group consisting of  $\text{—H}$ ;  $\text{—F}$ ;  $\text{—CF}_3$ ;  $\text{—(C}_1\text{—C}_6\text{) alkyl}$ ;  $\text{—(C}_3\text{—C}_7\text{) cycloalkyl}$ ; phenyl; benzyl; and a heterocyclic moiety selected from the group consisting of pyrrolyl; pyrazolyl; imidazolyl; pyridinyl; pyrazinyl; pyrimidinyl; pyridazinyl; oxazolyl; oxazolidinyl; *iso*-oxazolyl; thiazolyl; thiazolidinyl; *iso*-thiazolyl; triazolyl; tetrazolyl; oxadiazolyl; and thiadiazolyl; wherein said alkyl, cycloalkyl, phenyl, benzyl, or heterocyclic moiety is each independently substituted with 0 to 3 substituents  $\text{R}^{10}$ ;

— provided that —

25 for the above and all other meanings of  $\text{R}^A$  and  $\text{R}^B$ , when  $\text{R}^{10}$  as a substituent of  $\text{R}^A$  or  $\text{R}^B$  has the meaning of  $\text{—OR}^{12}$ ,  $\text{—O—C(=O)R}^{13}$ , or  $\text{—OC(=O)NR}^{12}\text{R}^{13}$ , the positional relationship of

- 176 -

said  $-OR^{12}$ ,  $-O-C(=O)R^{13}$ , or  $-OC(=O)NR^{12}R^{13}$  to  $-OR^{12}$  as a meaning of  $Z$ , is other than a vicinal one;

- where -

5  $-R^{10}$  is a member selected from the group consisting of  $-F$ ;  $-Cl$ ;  $-CF_3$ ;  $-CN$ ;  $(C_1-C_2)$  alkyl;  $-OR^{12}$ ;  $-C(=O)OR^{12}$ ;  $-O-C(=O)R^{13}$ ;  $-C(=O)NR^{12}R^{13}$ ;  $-O-C(=O)NR^{12}R^{13}$ ;  $-NR^{12}R^{13}$ ;  $-NR^{12}C(=O)R^{13}$ ;  $-NR^{12}C(=O)OR^{13}$ ;  $-NR^{12}S(=O)_2R^{13}$ ; and  $-S(=O)_2NR^{12}R^{13}$ ;

- where -

10  $---R^{12}$  and  $R^{13}$  are each a member independently selected from the group consisting of  $-H$ ;  $-(C_1-C_4)$  alkyl;  $(C_2-C_4)$  alkenyl;  $(C_3-C_6)$  cycloalkyl; phenyl; benzyl; and a monocyclic heterocyclic moiety comprising  $(C_3-C_6)$  cycloalkyl wherein a nitrogen heteroatom replaces one carbon atom, and optionally a second nitrogen heteroatom replaces a second carbon atom of a 5- or 6-membered said heterocyclic moiety, and further optionally wherein an oxygen heteroatom replaces a third carbon atom of a 5- or 6-membered said heterocyclic moiety; wherein said alkyl, alkenyl, cycloalkyl, phenyl, benzyl, or monocyclic heterocyclic moiety is substituted by 0 to 3 substituents selected from the group consisting of F and Cl;

- or -

$-R^A$  and  $R^B$  are taken together, provided that m is 1, to form a spiro moiety of Formula (1.1.0):

20

(1.1.0)

- where -

$-r$  and  $s$  are independently 0 to 4 provided that the sum of  $r + s$  is at least 1 but not greater than 5;

- and -

25  $-Q^A$  is selected from  $-CH_2-$ ,  $-CHF-$ ,  $-CF_2-$ ,  $-NR^{12}-$ ,  $-O-$ ; and  $-S(=O)_t-$ , where  $t$  is 0, 1, or 2; and said spiro moiety is substituted as to any one or more carbon atoms thereof, including the carbon atom of the group  $-CH_2-$  defining  $Q^A$ , by 0 to 3 substituents  $R^{10}$ , where  $R^{10}$  and  $R^{12}$  have the same meanings as defined above; provided that for the above and all other meanings of  $R^A$  and  $R^B$ , when  $R^{10}$  as a substituent of  $R^A$  or  $R^B$  has the meaning of

$-\text{OR}^{12}$ ,  $-\text{O}-\text{C}(=\text{O})\text{R}^{13}$ , or  $-\text{OC}(=\text{O})\text{NR}^{12}\text{R}^{13}$ , the positional relationship of said  $-\text{OR}^{12}$ ,  $-\text{O}-\text{C}(=\text{O})\text{R}^{13}$ , or  $-\text{OC}(=\text{O})\text{NR}^{12}\text{R}^{13}$  to  $-\text{OR}^{12}$  as a meaning of  $\text{Z}$ , is other than a vicinal one;

$-\text{R}^{\text{C}}$  and  $\text{R}^{\text{D}}$  have the same meaning as defined above for  $\text{R}^{\text{A}}$  and  $\text{R}^{\text{B}}$ , except that at least one of  $\text{R}^{\text{C}}$  and  $\text{R}^{\text{D}}$  must be  $-\text{H}$ , and they are selected independently of each other and of  $\text{R}^{\text{A}}$  and  $\text{R}^{\text{B}}$ ;

$-\text{Q}$  is phenyl; pyrrolyl; furanyl; thienyl; pyridyl; pyrimidinyl; imidazolyl; thiazolyl; oxazolyl; a monocyclic  $-(\text{C}_5-\text{C}_7)$  cycloalkyl moiety; a monocyclic  $-(\text{C}_5-\text{C}_7)$  cycloalkenyl moiety that is a member selected from the group consisting of cyclopentenyl, cyclohexenyl, and cycloheptenyl; or a bicyclic  $-(\text{C}_7-\text{C}_{10})$  cycloalkyl or  $-(\text{C}_7-\text{C}_{10})$  cycloalkenyl moiety, preferably one that is a member selected from the group consisting of norbornanyl, norbornenyl, bicyclo[2.2.2]octanyl, bicyclo[3.2.1]octanyl, bicyclo[3.3.0]octanyl, bicyclo[2.2.2]oct-5-enyl, bicyclo[2.2.2]oct-7-enyl, bicyclo[3.3.1]nonanyl, and adamantanyl;

$-\text{R}^1$  and  $\text{R}^2$  are each a member independently selected from the group consisting of  $-\text{H}$ ;  $-\text{F}$ ;  $-\text{Cl}$ ;  $-\text{R}^{12}$ ;  $-\text{OR}^{12}$ ;  $-\text{S}(=\text{O})_p\text{R}^{12}$ ;  $-\text{C}(=\text{O})\text{OR}^{12}$ ;  $-\text{OC}(=\text{O})\text{R}^{12}$ ;  $-\text{CN}$ ;  $-\text{NO}_2$ ;  $-\text{C}(=\text{O})\text{NR}^{12}\text{R}^{13}$ ;  $-\text{OC}(=\text{O})\text{NR}^{12}\text{R}^{13}$ ;  $-\text{NR}^{14}\text{C}(=\text{O})\text{NR}^{15}\text{R}^{12}$ ;  $-\text{NR}^{14}\text{C}(=\text{NR}^{14})\text{NR}^{15}\text{R}^{12}$ ;  $-\text{NR}^{14}\text{C}(=\text{NCN})\text{NR}^{15}\text{R}^{12}$ ;  $-\text{NR}^{14}\text{C}(=\text{N}-\text{NO}_2)\text{NR}^{15}\text{R}^{12}$ ;  $-\text{C}(=\text{NR}^{14})\text{NR}^{15}\text{R}^{12}$ ;  $-\text{OC}(=\text{NR}^{14})\text{NR}^{15}\text{R}^{12}$ ;  $-\text{OC}(=\text{N}-\text{NO}_2)\text{NR}^{15}\text{R}^{12}$ ;  $-\text{NR}^{15}\text{R}^{12}$ ;  $-\text{CH}_2\text{NR}^{15}\text{R}^{12}$ ;  $-\text{NR}^{14}\text{C}(=\text{O})\text{R}^{12}$ ;  $-\text{NR}^{14}\text{C}(=\text{O})\text{OR}^{12}$ ;  $-\text{NR}^{14}\text{S}(=\text{O})_p\text{R}^{13}$ ; and  $-\text{S}(=\text{O})_p\text{NR}^{12}\text{R}^{13}$ ; where  $p$  is 0, 1, or 2;  $\text{R}^{12}$  and  $\text{R}^{13}$  have the same meanings as defined above; and  $\text{R}^{14}$  and  $\text{R}^{15}$  have the same meanings as defined below;

$-\text{R}^3$  is  $-\text{H}$ ;  $-(\text{C}_1-\text{C}_3)$  alkyl;  $-(\text{C}_1-\text{C}_3)$  alkoxy;  $-\text{OH}$ ; phenyl; or benzyl;

$-\text{R}^4$  is a member independently selected from the group consisting of

– the following –

$-(a)$   $-\text{H}$ ;  $-\text{F}$ ;  $-\text{Cl}$ ;  $-(\text{C}_2-\text{C}_4)$  alkynyl;  $-\text{R}^{12}$ ;  $-\text{OR}^{12}$ ;  $-\text{S}(=\text{O})_p\text{R}^{12}$ ;  $-\text{C}(=\text{O})\text{OR}^{12}$ ;  $-\text{OC}(=\text{O})\text{R}^{12}$ ;  $-\text{CN}$ ;  $-\text{NO}_2$ ;  $-\text{C}(=\text{O})\text{NR}^{15}\text{R}^{12}$ ;  $-\text{OC}(=\text{O})\text{NR}^{15}\text{R}^{12}$ ;  $-\text{NR}^{14}\text{C}(=\text{O})\text{NR}^{15}\text{R}^{12}$ ;  $-\text{NR}^{14}\text{C}(=\text{NR}^{14})\text{NR}^{15}\text{R}^{12}$ ;  $-\text{NR}^{14}\text{C}(=\text{NCN})\text{NR}^{15}\text{R}^{12}$ ;  $-\text{NR}^{14}\text{C}(=\text{N}-\text{NO}_2)\text{NR}^{15}\text{R}^{12}$ ;  $-\text{C}(=\text{NR}^{14})\text{NR}^{15}\text{R}^{12}$ ;  $-\text{OC}(=\text{NR}^{14})\text{NR}^{15}\text{R}^{12}$ ;  $-\text{OC}(=\text{N}-\text{NO}_2)\text{NR}^{15}\text{R}^{12}$ ;  $-\text{NR}^{15}\text{R}^{12}$ ;  $-\text{CH}_2\text{NR}^{15}\text{R}^{12}$ ;  $-\text{NR}^{14}\text{C}(=\text{O})\text{R}^{12}$ ;  $-\text{NR}^{14}\text{C}(=\text{O})\text{OR}^{12}$ ;  $-\text{NR}^{14}\text{S}(=\text{O})_p\text{R}^{15}$ ;  $-\text{S}(=\text{O})_p\text{NR}^{15}\text{R}^{12}$ ; and  $-\text{CH}_2\text{C}(=\text{NR}^{14})\text{NR}^{15}\text{R}^{12}$ ; where  $p$  is 0, 1, or 2; and  $\text{R}^{12}$  has the same meaning as defined above;

– where –

$-\text{R}^{14}$  is selected from the group consisting of  $-\text{H}$ ;  $-\text{CH}_3$ ; and  $-\text{CH}_2\text{CH}_3$ ;

- 178 -

5. --R<sup>15</sup> is a member independently selected from the group consisting of -H; -C(=O)OR<sup>12</sup>; -C(=O)NR<sup>12</sup>R<sup>13</sup>; -(C<sub>1</sub>-C<sub>4</sub>) alkyl; -(C<sub>2</sub>-C<sub>4</sub>) alkenyl; -(C<sub>1</sub>-C<sub>2</sub>) alkoxy; -(C<sub>3</sub>-C<sub>7</sub>) cycloalkyl; and phenyl; where R<sup>12</sup> and R<sup>13</sup> have the same meaning as defined above; and said alkyl, alkenyl, alkoxy, cycloalkyl and phenyl are substituted with 0 to 2 substituents R<sup>21</sup>;

- where -

10. --R<sup>21</sup> is a member independently selected from the group consisting of -F; -Cl; -C(=O)OR<sup>23</sup> where R<sup>23</sup> and R<sup>24</sup> have the same meanings as defined below; -OH; -CN; -C(=O)NR<sup>23</sup>R<sup>24</sup>; -NR<sup>23</sup>R<sup>24</sup>; -NR<sup>23</sup>C(=O)R<sup>24</sup>; -NR<sup>23</sup>C(=O)OR<sup>24</sup>; -NR<sup>23</sup>S(=O)<sub>p</sub>R<sup>24</sup> and -S(=O)<sub>p</sub>NR<sup>23</sup>R<sup>24</sup>, where p has the same meaning as defined above; -(C<sub>1</sub>-C<sub>4</sub>) alkyl including dimethyl; and -(C<sub>1</sub>-C<sub>4</sub>) alkoxy; wherein said alkyl and alkoxy are each independently substituted with 0 to 3 substituents independently selected from -F and -Cl; -(C<sub>1</sub>-C<sub>2</sub>) alkoxycarbonyl; -(C<sub>1</sub>-C<sub>2</sub>) alkylcarbonyl; and -(C<sub>1</sub>-C<sub>2</sub>) alkylcarbonyloxy;

- where -

15. ---R<sup>23</sup> and R<sup>24</sup> are each independently -H; or -(C<sub>1</sub>-C<sub>2</sub>) alkyl;

- and further R<sup>4</sup> -

20. -(b) is independently selected from -(C<sub>1</sub>-C<sub>4</sub>) alkyl; and -(C<sub>1</sub>-C<sub>4</sub>) alkoxy wherein said alkyl and alkoxy are each independently substituted with 0 to 3 substituents -F or -Cl; or 0 or 1 substituent (C<sub>1</sub>-C<sub>2</sub>) alkoxycarbonyl-; (C<sub>1</sub>-C<sub>2</sub>) alkylcarbonyl-; or (C<sub>1</sub>-C<sub>2</sub>) alkylcarbonyloxy-;

- and still further R<sup>4</sup> -

25. -(c) is independently selected from an aryl or heterocyclic moiety selected from the group consisting of phenyl; benzyl; furyl; tetrahydrofuranyl; oxetanyl; thienyl; tetrahydrothienyl; pyrrolyl; pyrrolidinyl; oxazolyl; oxazolidinyl; isoxazolyl; isoxazolidinyl; thiazolyl; thiazolidinyl; isothiazolyl; isothiazolidinyl; pyrazolyl; pyrazolidinyl; oxadiazolyl; thiadiazolyl; imidazolyl; imidazolidinyl; pyridinyl; pyrazinyl; pyrimidinyl; pyridazinyl; piperidinyl; piperazinyl; triazolyl; triazinyl; tetrazolyl; pyranyl; azetidyl; morpholinyl, parathiazinyl; indolyl; indolinyl; benzo[b]furanyl; 2,3-dihydrobenzofuranyl; 2-H-chromenyl; chromanyl; benzothienyl; 1-H-indazolyl; benzimidazolyl; benzoxazolyl; benzisoxazolyl; benzthiazolyl; 30 quinolinyl; isoquinolinyl; phthalazinyl; quinazolinyl; quinoxalinyl; and purinyl;

- wherein -

said alkyl, alkoxy, aryl and heterocyclic moieties are each independently substituted with 0 to 3 substituents R<sup>10</sup> where R<sup>10</sup> has the same meaning as defined above;

- 179 -

$-R^5$  and  $R^6$  are taken together to form a moiety which is a member selected from the group consisting of partial Formulas (1.1.1) through (1.1.5):

5

- wherein -

$-R^7$  and  $R^8$  are each independently  $-H$ ;  $-CH_3$ ;  $-OR^{14}$  where  $R^{14}$  has the same meaning as defined above; or absent, in which case the dashed line  $---$  represents a double bond;

- and -

10  $-Z$  is independently selected from the group consisting of  $-OR^{12}$ ;  $-C(=O)R^{12}$ ; and  $-CN$ ; where  $R^{12}$  has the same meaning as defined above;

- or -

a pharmaceutically acceptable salt thereof.

15

2. A compound according to Claim 1 wherein  $m$  is 1 and  $n$  is 1;  $R^A$  and  $R^B$  are  $-H$ ,  $-CF_3$ , or  $-(C_1-C_6)$  alkyl substituted by 0 or 1 of  $-F$ ,  $-Cl$ ,  $-CF_3$ ,  $-CN$ ,  $-NH_2$ , or  $-C(=O)NH_2$ , or both taken together are spiro  $-(C_3-C_6)$  cycloalkyl- substituted by 0 or 1 of  $-F$ ,  $-Cl$ ,  $-CF_3$ , or  $-CN$ ; one of  $R^C$  and  $R^D$  is  $-H$ , and the other is  $-H$ ,  $-(C_1-C_4)$  alkyl, or phenyl, each substituted by 0 or 1 of  $-F$ ,  $-Cl$ , or  $-CN$ ;  $W$  is  $-O-$ ;  $Y$  is  $=C(R^E)-$  where  $R^E$  is  $-H$ ,  $-F$ ,  $-Cl$ ,  $-CN$ ,  $-CH_3$ , or  $-OCH_3$ ;  $R^1$  and  $R^2$  are  $-H$ ,  $-F$ ,  $-Cl$ ,  $-CN$ ,  $-NO_2$ ,  $-OH$ ,  $-CH_3$ ,  $-OCH_3$ ,  $-OCHF_2$ , or  $-OCF_3$ ;  $R^3$  is  $-H$  or  $-CH_3$ ;  $R^4$  is  $-H$ ,  $-F$ ,  $-CN$ ,  $-NO_2$ ,  $-OH$ ,  $-CH_3$ , or  $-OCH_3$ ;  $R^5$  and  $R^6$  are taken together to form a moiety of partial Formula (1.1.1), partial Formula (1.1.4), or partial Formula (1.1.5) where  $R^7$  and  $R^8$  are absent in each said partial Formula,  $-H$ , or  $-CH_3$ ;  $Q$  is phenyl, norbornanyl, furanyl, thienyl, pyrimidinyl, cyclohexenyl, or cyclohexyl; and  $Z$  is  $-OR^{12}$  or  $-C(=O)R^{12}$  where  $R^{12}$  is  $-H$ ,  $-CH_3$ ,  $-CH_2CH_3$ , or  $-C(CH_3)_3$ ; or  $Z$  is  $-CN$ .

25

3. A compound according to Claim 2 wherein  $R^A$  and  $R^B$  are both  $-CH_3$ , or one is  $-CH_3$  and the other is  $-CH(CH_3)_2$  or  $-C(CH_3)_3$ , or one is  $-H$  and the other is  $-CH_3$  or  $-CF_3$ , or both taken together are spiro cyclopropyl or spiro cyclobutyl; one of  $R^C$  and  $R^D$  is  $-H$  and

the other is -H or -CH<sub>3</sub>; Y is =C(R<sup>E</sup>)— where R<sup>E</sup> is -H, -F, or -Cl; R<sup>1</sup> and R<sup>2</sup> are -H, -F, or Cl; R<sup>3</sup> is -H; R<sup>4</sup> is -H; R<sup>5</sup> and R<sup>6</sup> are taken together to form a moiety of partial Formula (1.1.1) or partial Formula (1.1.4) where R<sup>7</sup> and R<sup>8</sup> are both absent; Q is phenyl, thienyl, cyclohexenyl, or cyclohexyl; and Z is -OR<sup>12</sup> where R<sup>12</sup> is -H, or Z is -C(=O)R<sup>12</sup> where R<sup>12</sup> is -H or -CH<sub>3</sub>, or Z is -CN.

4. A compound according to Claim 3 wherein R<sup>A</sup> and R<sup>B</sup> are both -CH<sub>3</sub>, or both taken together are spiro cyclopropyl; one of R<sup>C</sup> and R<sup>D</sup> is -H and the other is -H or -CH<sub>3</sub>; Y is =C(R<sup>E</sup>)— where R<sup>E</sup> is -H, -F, or -Cl; R<sup>1</sup> and R<sup>2</sup> are -H, -F, or Cl; R<sup>3</sup> is -H; R<sup>4</sup> is -H; R<sup>5</sup> and R<sup>6</sup> are taken together to form a moiety of partial Formula (1.1.1) where R<sup>7</sup> and R<sup>8</sup> are both absent; and Z is -OR<sup>12</sup> where R<sup>12</sup> is -H.

5. A compound according to Claim 4 wherein R<sup>A</sup> and R<sup>B</sup> are both -CH<sub>3</sub>; R<sup>C</sup> and R<sup>D</sup> are both -H; Y is =C(R<sup>E</sup>)— where R<sup>E</sup> is -H; and one of R<sup>1</sup> and R<sup>2</sup> is -H and the other is -F.

6. A compound according to Claim 2 wherein Y is =C(R<sup>E</sup>)— where R<sup>E</sup> is -F; and R<sup>1</sup> and R<sup>2</sup> are both -H.

7. A compound according to Claim 6 wherein R<sup>5</sup> and R<sup>6</sup> are taken together to form a moiety of partial Formula (1.1.4), and further wherein R<sup>A</sup> and R<sup>B</sup> are both -CH<sub>3</sub>, or one is -H and the other is -CH<sub>3</sub>, or both together are spiro cyclopropyl; one of R<sup>C</sup> and R<sup>D</sup> is -H and the other is -H or -CH<sub>3</sub>; Y is =C(R<sup>E</sup>)— where R<sup>E</sup> is -H or -F; R<sup>1</sup> and R<sup>2</sup> are -H, -F, or Cl; R<sup>3</sup> is -H; R<sup>4</sup> is -H; R<sup>7</sup> and R<sup>8</sup> are both absent; Q is phenyl, norbornanyl, furanyl, thienyl, pyrimidinyl, or cyclohexyl; and Z is -OR<sup>12</sup> where R<sup>12</sup> is -H.

8. A compound according to Claim 1 wherein m is 1 and n is 1; R<sup>A</sup> and R<sup>B</sup> are -H, -CF<sub>3</sub>, or -(C<sub>1</sub>-C<sub>6</sub>) alkyl substituted by 0 or 1 of -F, -Cl, -CF<sub>3</sub>, -CN, -NH<sub>2</sub>, or -C(=O)NH<sub>2</sub>, or both taken together are spiro -(C<sub>3</sub>-C<sub>6</sub>) cycloalkyl— substituted by 0 or 1 of -F, -Cl, -CF<sub>3</sub>, or -CN; one of R<sup>C</sup> and R<sup>D</sup> is -H, and the other is -H, -(C<sub>1</sub>-C<sub>4</sub>) alkyl, or phenyl, each substituted by 0 or 1 of -F, -Cl, or -CN; W is -O-; Y is =C(R<sup>E</sup>)— where R<sup>E</sup> is -H, -F, -Cl, -CN, -CH<sub>3</sub>, or -OCH<sub>3</sub>; R<sup>1</sup> and R<sup>2</sup> are -H, -F, -Cl, -CN, -NO<sub>2</sub>, -OH, -CH<sub>3</sub>, -OCH<sub>3</sub>, -OCHF<sub>2</sub>, or -OCF<sub>3</sub>; R<sup>3</sup> is -H; R<sup>4</sup> is -H, -F, -CN, -NO<sub>2</sub>, -OH, -CH<sub>3</sub>, or -OCH<sub>3</sub>; R<sup>5</sup> and R<sup>6</sup> are taken together to form a moiety of partial Formula (1.1.5) where R<sup>7</sup> is -H or -CH<sub>3</sub>; Q is phenyl, norbornanyl, furanyl, thienyl, pyrimidinyl, cyclohexenyl, or cyclohexyl; and Z is -OR<sup>12</sup>, where R<sup>12</sup> is -H, -CH<sub>3</sub>, -CH<sub>2</sub>CH<sub>3</sub>, or -C(CH<sub>3</sub>)<sub>3</sub>; or Z is -CN.

9. A compound according to Claim 1 wherein  $R^A$  and  $R^B$  are both  $-\text{CH}_3$ , or one is  $-\text{CH}_3$  and the other is  $-\text{CH}(\text{CH}_3)_2$  or  $-\text{C}(\text{CH}_3)_3$ , or one is  $-\text{H}$  and the other is  $-\text{CH}_3$  or  $-\text{CF}_3$ , or both taken together are spiro cyclopropyl or spiro cyclobutyl; one of  $R^C$  and  $R^D$  is  $-\text{H}$  and the other is  $-\text{H}$  or  $-\text{CH}_3$ ;  $Y$  is  $=\text{C}(\text{R}^E)-$  where  $\text{R}^E$  is  $-\text{H}$ ,  $-\text{F}$ , or  $-\text{Cl}$ ;  $\text{R}^1$  and  $\text{R}^2$  are  $-\text{H}$ ,  $-\text{F}$ , or  $\text{Cl}$ ;  $\text{R}^3$  is  $-\text{H}$ ;  $\text{R}^4$  is  $-\text{H}$ ;  $Q$  is phenyl, thienyl, cyclohexenyl, or cyclohexyl; and  $Z$  is  $-\text{OR}^{12}$  where  $\text{R}^{12}$  is  $-\text{H}$ , or  $Z$  is  $-\text{C}(=\text{O})\text{R}^{12}$  where  $\text{R}^{12}$  is  $-\text{H}$  or  $-\text{CH}_3$ , or  $Z$  is  $-\text{CN}$ .

10. A compound according to Claim 1 wherein said compound is a member selected from the group consisting of the following:

2-[Benzo[2,1,3]oxadiazol-5-yl-oxy]-N-[4-[1-hydroxy-1-methyl-ethyl]-benzyl]-nicotinamide of Formula (5.5.1);

2-[Benzo[2,1,3]oxadiazol-5-yl-oxy]-N-[2-fluoro-4-[1-hydroxy-1-methyl-ethyl]-benzyl]-nicotinamide of Formula (5.5.2);

*Trans*-2-[Benzo[2,1,3]oxadiazol-5-yl-oxy]-N-[4-[1-hydroxy-1-methyl-ethyl]-cyclohexyl-methyl]-nicotinamide of Formula (5.5.3);

2-(2-Methyl-benzo[1,2,3]triazol-5-yl-oxy)-N-[2-fluoro-4-(1-hydroxy-cyclopropyl)-benzyl]-nicotinamide of Formula (5.5.32);

*Trans*-2-[2-Methyl-benzo[1,2,3]triazol-5-yl-oxy]-N-[4-[1-hydroxy-1-methyl-ethyl]-cyclohexyl-methyl]-nicotinamide of Formula (5.5.33);

2-[Benzo[2,1,3]oxadiazol-5-yl-oxy]-N-[4-[1-hydroxy-1-methyl-ethyl]-cyclopent-1-enyl-methyl]-nicotinamide of Formula (5.5.34);

2-[Benzo[2,1,3]oxadiazol-5-yl-oxy]-N-[3-[1-hydroxy-1-methyl-ethyl]-norbornan-6-yl-methyl]-nicotinamide of Formula (5.5.35); 2-[Benzo[2,1,3]oxadiazol-5-yl-oxy]-N-[3-[1-hydroxy-1-methyl-ethyl]-norbornan-6-yl-methyl]-nicotinamide

2-[Benzo[2,1,3]oxadiazol-5-yl-oxy]-N-[3-[1-hydroxy-1-methyl-ethyl]-7-fluoro-norborn-5-en-6-yl-methyl]-nicotinamide of Formula (5.5.36);

2-[Benzo[2,1,3]oxadiazol-5-yl-oxy]-N-[2-[2,2,2-trifluoro-1-hydroxy-ethyl]-bicyclo[2.2.2]octan-5-yl-methyl]-nicotinamide of Formula (5.5.37);

2-[Benzo[2,1,3]oxadiazol-5-yl-oxy]-N-[3-acetyl-bicyclo[2.2.2]oct-7-en-5-yl-methyl]-nicotinamide of Formula (5.5.38);

2-[Benzo[2,1,3]oxadiazol-5-yl-oxy]-N-[8-(1-hydroxy-1-methyl-ethyl)-bicyclo[3.2.1]octan-3-yl-methyl]-nicotinamide of Formula (5.5.39);

(±)-2-[Benzo[2,1,3]oxadiazol-5-yl-oxy]-N-[5-[1-hydroxy-ethyl]-furan-2-yl-methyl]-nicotinamide of Formula (5.5.40);

2-[Benzo[2,1,3]oxadiazol-5-yl-oxy]-N-[5-[1-hydroxy-1-methyl-ethyl]-pyridin-2-yl-methyl]-nicotinamide of Formula (5.5.41);

2-[Benzo[2,1,3]oxadiazol-5-yl-oxy]-N-[5-[1-hydroxy-1-methyl-ethyl]-oxazol-2-yl-methyl]-nicotinamide of Formula (5.5.42);

2-[Benzo[2,1,3]oxadiazol-5-yl-oxy]-N-[5-[1-hydroxy-1-methyl-ethyl]-thiazol-2-yl-methyl]-nicotinamide of Formula (5.5.43);

2-[Benzo[2,1,3]oxadiazol-5-yl-oxy]-N-[6-[1-hydroxy-1-methyl-ethyl]-pyridin-3-yl-methyl]-nicotinamide of Formula (5.5.44);

2-[Benzo[2,1,3]oxadiazol-5-yl-oxy]-N-[5-(1-hydroxy-cyclopropyl)-pyridin-2-yl-methyl]-nicotinamide of Formula (5.5.45);

2-[Benzo[2,1,3]oxadiazol-5-yl-oxy]-N-[5-(1-hydroxy-1,2-dimethyl-propyl)-oxazol-2-yl-methyl]-nicotinamide of Formula (5.5.46);

2-[Benzo[2,1,3]oxadiazol-5-yl-oxy]-N-[5-(1-cyano-1-methyl-ethyl)-thiazol-2-yl-methyl]-nicotinamide of Formula (5.5.47);

2-[Benzo[2,1,3]oxadiazol-5-yl-thio]-N-[2-fluoro-4-[1-hydroxy-1-methyl-ethyl]-benzyl]-nicotinamide of Formula (5.5.48);

2-[Benzo[2,1,3]oxadiazol-5-yl-thio]-N-[2-fluoro-4-[1-hydroxy-1-methyl-ethyl]-benzyl]-nicotinamide of Formula (5.5.49);

(±)-2-(Benzo[2,1,3]oxadiazol-5-yl-thio)-N-[1-[2-fluoro-4-(1-hydroxy-1-methyl-ethyl)-phenyl]-ethyl]-nicotinamide of Formula (5.5.50);

2-(Benzo[2,1,3]oxadiazol-5-yl-thio)-N-[2-fluoro-4-(1-hydroxy-cyclopropyl)-benzyl]-nicotinamide of Formula (5.5.51);

2-[Benzo[2,1,3]thiadiazol-5-yl-thio]-N-[4-[1-hydroxy-1-methyl-ethyl]-benzyl]-nicotinamide of Formula (5.5.52);

2-[2-Methyl-benzo[1,2,3]triazol-5-yl-thio]-N-[2-fluoro-4-[1-hydroxy-1-methyl-ethyl]-benzyl]-nicotinamide of Formula (5.5.53);

2-[Benzo[2,1,3]oxadiazol-5-yl-thio]-N-[4-[1-hydroxy-1-methyl-ethyl]-cyclopent-1-enyl-methyl]-nicotinamide of Formula (5.5.54);

2-[Benzo[2,1,3]oxadiazol-5-yl-thio]-N-[3-[1-hydroxy-1-methyl-ethyl]-7-fluoro-norborn-5-en-6-yl-methyl]-nicotinamide of Formula (5.5.55);

(±)-2-[Benzo[2,1,3]oxadiazol-5-yl-thio]-N-[5-[1-hydroxy-ethyl]-furan-2-yl-methyl]-nicotinamide of Formula (5.5.56);

2-[Benzo[2,1,3]oxadiazol-5-yl-thio]-N-[5-[1-hydroxy-1-methyl-ethyl]-pyridin-2-yl-methyl]-nicotinamide of Formula (5.5.57);

2-[Benzo[2,1,3]oxadiazol-5-yl-thio]-N-[5-[1-hydroxy-1-methyl-ethyl]-oxazol-2-yl-methyl]-nicotinamide of Formula (5.5.58);

2-[Benzo[2,1,3]thiadiazol-5-yl-oxy]-N-[4-[1-hydroxy-1-methyl-ethyl]-cyclopent-1-enyl-methyl]-nicotinamide of Formula (5.5.59);

2-[2-Methyl-benzo[1,2,3]triazol-5-yl-oxy]-N-[3-[1-hydroxy-1-methyl-ethyl]-norbornan-6-yl-methyl]-nicotinamide of Formula (5.5.60);

2-[Benzo[2,1,3]thiadiazol-5-yl-thio]-N-[3-[1-hydroxy-1-methyl-ethyl]-7-fluoro-norborn-5-en-6-yl-methyl]-nicotinamide of Formula (5.5.61);

2-[2-Methyl-benzo[1,2,3]triazol-5-yl-oxy]-N-[3-acetyl-bicyclo[2.2.2]oct-7-en-5-yl-methyl]-nicotinamide of Formula (5.5.62);

(±)-2-[Benzo[2,1,3]thiadiazol-5-yl-oxy]-N-[5-[1-hydroxy-ethyl]-furan-2-yl-methyl]-nicotinamide of Formula (5.5.63); and

2-[2-Methyl-benzo[1,2,3]triazol-5-yl-oxy]-N-[5-[1-hydroxy-1-methyl-ethyl]-pyridin-2-yl-methyl]-nicotinamide of Formula (5.5.64).

11. A method of treating a subject suffering from a disease, disorder or condition mediated by the PDE4 isozyme, whereby it regulates the activation and degranulation of eosinophils, comprising administering to said subject in need of said treatment a therapeutically effective amount of a compound of Formula (1.0.0) as defined in Claim 1.

5 12. A pharmaceutical composition for use in treating a subject suffering from a disease, disorder or condition mediated by the PDE4 isozyme, whereby it regulates the activation and degranulation of eosinophils, comprising a therapeutically effective amount of a compound of Formula (1.0.0) as defined in Claim 1, together with a pharmaceutically acceptable carrier therefor.

10 13. A method according to Claim 11 wherein said disease, disorder, or condition comprises one or more members selected from the group consisting of:

– asthma of whatever type, etiology, or pathogenesis; or asthma that is a member selected from the group consisting of atopic asthma; non-atopic asthma; allergic asthma; atopic, bronchial, IgE-mediated asthma; bronchial asthma; essential asthma; true asthma; 15 intrinsic asthma caused by pathophysiologic disturbances; extrinsic asthma caused by environmental factors; essential asthma of unknown or inapparent cause; non-atopic asthma; bronchitic asthma; emphysematous asthma; exercise-induced asthma; occupational asthma;

infective asthma caused by bacterial, fungal, protozoal, or viral infection; non-allergic asthma; incipient asthma; wheezy infant syndrome;

– chronic or acute bronchoconstriction; chronic bronchitis; small airways obstruction; and emphysema;

- 5           – obstructive or inflammatory airways diseases of whatever type, etiology, or pathogenesis; or an obstructive or inflammatory airways disease that is a member selected from the group consisting of asthma; pneumoconiosis; chronic eosinophilic pneumonia; chronic obstructive pulmonary disease (COPD); COPD that includes chronic bronchitis, pulmonary emphysema or dyspnea associated therewith; COPD that is characterized by  
10 irreversible, progressive airways obstruction; adult respiratory distress syndrome (ARDS), and exacerbation of airways hyper-reactivity consequent to other drug therapy;

- pneumoconiosis of whatever type, etiology, or pathogenesis; or pneumoconiosis that is a member selected from the group consisting of aluminosis or bauxite workers' disease; anthracosis or miners' asthma; asbestosis or steam-fitters' asthma; chalicosis or flint  
15 disease; ptilosis caused by inhaling the dust from ostrich feathers; siderosis caused by the inhalation of iron particles; silicosis or grinders' disease; byssinosis or cotton-dust asthma; and talc pneumoconiosis;

- bronchitis of whatever type, etiology, or pathogenesis; or bronchitis that is a member selected from the group consisting of acute bronchitis; acute laryngotracheal  
20 bronchitis; arachidic bronchitis; catarrhal bronchitis; croupus bronchitis; dry bronchitis; infectious asthmatic bronchitis; productive bronchitis; staphylococcus or streptococcal bronchitis; and vesicular bronchitis;

- bronchiectasis of whatever type, etiology, or pathogenesis; or bronchiectasis that is a member selected from the group consisting of cylindric bronchiectasis; sacculated  
25 bronchiectasis; fusiform bronchiectasis; capillary bronchiectasis; cystic bronchiectasis; dry bronchiectasis; and follicular bronchiectasis;

- seasonal allergic rhinitis; or perennial allergic rhinitis; or sinusitis of whatever type, etiology, or pathogenesis; or sinusitis that is a member selected from the group consisting of purulent or nonpurulent sinusitis; acute or chronic sinusitis; and ethmoid, frontal, maxillary, or  
30 sphenoid sinusitis;

- rheumatoid arthritis of whatever type, etiology, or pathogenesis; or rheumatoid arthritis that is a member selected from the group consisting of acute arthritis; acute gouty arthritis; chronic inflammatory arthritis; degenerative arthritis; infectious arthritis; Lyme arthritis; proliferative arthritis; psoriatic arthritis; and vertebral arthritis;

- 35           – gout, and fever and pain associated with inflammation;

– an eosinophil-related disorder of whatever type, etiology, or pathogenesis; or an eosinophil-related disorder that is a member selected from the group consisting of eosinophilia; pulmonary infiltration eosinophilia; Löffler's syndrome; chronic eosinophilic pneumonia; tropical pulmonary eosinophilia; bronchopneumonic aspergillosis; aspergilloma; 5 granulomas containing eosinophils; allergic granulomatous angiitis or Churg-Strauss syndrome; polyarteritis nodosa (PAN); and systemic necrotizing vasculitis;

– atopic dermatitis; or allergic dermatitis; or allergic or atopic eczema;

– urticaria of whatever type, etiology, or pathogenesis; or urticaria that is a member selected from the group consisting of immune-mediated urticaria; complement-mediated 10 urticaria; urticariogenic material-induced urticaria; physical agent-induced urticaria; stress-induced urticaria; idiopathic urticaria; acute urticaria; chronic urticaria; angioedema; cholinergic urticaria; cold urticaria in the autosomal dominant form or in the acquired form; contact urticaria; giant urticaria; and papular urticaria;

– conjunctivitis of whatever type, etiology, or pathogenesis; or conjunctivitis that is a 15 member selected from the group consisting of actinic conjunctivitis; acute catarrhal conjunctivitis; acute contagious conjunctivitis; allergic conjunctivitis; atopic conjunctivitis; chronic catarrhal conjunctivitis; purulent conjunctivitis; and vernal conjunctivitis;

– uveitis of whatever type, etiology, or pathogenesis; or uveitis that is a member selected from the group consisting of inflammation of all or part of the uvea; anterior uveitis; 20 iritis; cyclitis; iridocyclitis; granulomatous uveitis; nongranulomatous uveitis; phacoantigenic uveitis; posterior uveitis; choroiditis; and chorioretinitis;

– psoriasis;

– multiple sclerosis of whatever type, etiology, or pathogenesis; or multiple sclerosis that is a member selected from the group consisting of primary progressive multiple sclerosis; 25 and relapsing remitting multiple sclerosis;

– autoimmune/inflammatory diseases of whatever type, etiology, or pathogenesis; or an autoimmune/inflammatory disease that is a member selected from the group consisting of autoimmune hematological disorders; hemolytic anemia; aplastic anemia; pure red cell anemia; idiopathic thrombocytopenic purpura; systemic lupus erythematosus; polychondritis; 30 scleroderma; Wegner's granulomatosis; dermatomyositis; chronic active hepatitis; myasthenia gravis; Stevens-Johnson syndrome; idiopathic sprue; autoimmune inflammatory bowel diseases; ulcerative colitis; Crohn's disease; endocrinopathy; Grave's disease; sarcoidosis; alveolitis; chronic hypersensitivity pneumonitis; primary biliary cirrhosis; juvenile diabetes or diabetes mellitus type I; anterior uveitis; granulomatous or posterior uveitis; 35 keratoconjunctivitis sicca; epidemic keratoconjunctivitis; diffuse interstitial pulmonary fibrosis

or interstitial lung fibrosis; idiopathic pulmonary fibrosis; cystic fibrosis; psoriatic arthritis; glomerulonephritis with and without nephrotic syndrome; acute glomerulonephritis; idiopathic nephrotic syndrome; minimal change nephropathy; inflammatory/hyperproliferative skin diseases; psoriasis; atopic dermatitis; contact dermatitis; allergic contact dermatitis; benign  
5 familial pemphigus; pemphigus erythematosus; pemphigus foliaceus; and pemphigus vulgaris;

- prevention of allogeneic graft rejection following organ transplantation;

- inflammatory bowel disease (IBD) of whatever type, etiology, or pathogenesis; or inflammatory bowel disease that is a member selected from the group consisting of ulcerative  
10 colitis (UC); collagenous colitis; colitis polyposa; transmural colitis; and Crohn's disease (CD);.

- septic shock of whatever type, etiology, or pathogenesis; or septic shock that is a member selected from the group consisting of renal failure; acute renal failure; cachexia; malarial cachexia; hypophyseal cachexia; uremic cachexia; cardiac cachexia; cachexia  
15 suprarenalis or Addison's disease; cancerous cachexia; and cachexia as a consequence of infection by the human immunodeficiency virus (HIV);

- liver injury;

- pulmonary hypertension; and hypoxia-induced pulmonary hypertension;

- bone loss diseases; primary osteoporosis; and secondary osteoporosis;

- central nervous system disorders of whatever type, etiology, or pathogenesis; or a  
20 central nervous system disorder that is a member selected from the group consisting of depression; Parkinson's disease; learning and memory impairment; tardive dyskinesia; drug dependence; arteriosclerotic dementia; and dementias that accompany Huntington's chorea, Wilson's disease, paralysis agitans, and thalamic atrophies;

- infection, especially infection by viruses wherein such viruses increase the  
25 production of TNF- $\alpha$  in their host, or wherein such viruses are sensitive to upregulation of TNF- $\alpha$  in their host so that their replication or other vital activities are adversely impacted, including a virus which is a member selected from the group consisting of HIV-1, HIV-2, and HIV-3; cytomegalovirus, CMV; influenza; adenoviruses; and Herpes viruses, including *Herpes*  
30 *zoster* and *Herpes simplex*;

- yeast and fungus infections wherein said yeast and fungi are sensitive to upregulation by TNF- $\alpha$  or elicit TNF- $\alpha$  production in their host, when administered in conjunction with other drugs of choice for the treatment of systemic yeast and fungus infections, including but not limited to, polymixins, Polymycin B; imidazoles, clotrimazole,

econazole, miconazole, and ketoconazole; triazoles, fluconazole and itranazole; and amphotericins, Amphotericin B and liposomal Amphotericin B; and

- 5        - ischemia-reperfusion injury; autoimmune diabetes; retinal autoimmunity; chronic lymphocytic leukemia; HIV infections; lupus erythematosus; kidney and ureter disease; urogenital and gastrointestinal disorders; and prostate diseases.

14.        A method of treatment according to Claim 13 wherein said disease, disorder, or condition is a member selected from the group consisting of (1) inflammatory diseases and conditions comprising: joint inflammation, rheumatoid arthritis, rheumatoid spondylitis, osteoarthritis, inflammatory bowel disease, ulcerative colitis, chronic glomerulonephritis, dermatitis, and Crohn's disease; (2) respiratory diseases and conditions comprising: asthma, acute respiratory distress syndrome, chronic pulmonary inflammatory disease, bronchitis, chronic obstructive airway disease, and silicosis; (3) infectious diseases and conditions comprising: sepsis, septic shock, endotoxic shock, gram negative sepsis, toxic shock syndrome, fever and myalgias due to bacterial, viral or fungal infection, and influenza; (4) immune diseases and conditions comprising: autoimmune diabetes, systemic lupus erythematosus, graft vs. host reaction, allograft rejections, multiple sclerosis, psoriasis, and allergic rhinitis; and (5) other diseases and conditions comprising: bone resorption diseases; reperfusion injury; cachexia secondary to infection or malignancy; cachexia secondary to human acquired immune deficiency syndrome (AIDS), human immunodeficiency virus (HIV) infection, or AIDS related complex (ARC); keloid formation; scar tissue formation; type 1 diabetes mellitus; and leukemia.

15.        The combination of a compound of Formula (1.0.0) as defined in Claim 1 together with one or more members selected from the group consisting of the following:

- (a)        Leukotriene biosynthesis inhibitors: 5-lipoxygenase (5-LO) inhibitors and 5-lipoxygenase activating protein (FLAP) antagonists selected from the group consisting of zileuton; ABT-761; fenleuton; tepoxalin; Abbott-79175; Abbott-85761; *N*-(5-substituted)-thiophene-2-alkylsulfonamides of Formula (5.2.8); 2,6-di-*tert*-butylphenol hydrazones of Formula (5.2.10); the class of methoxytetrahydropyrans which includes Zeneca ZD-2138 of Formula (5.2.11); the compound SB-210661 of Formula (5.2.12) and the class to which it belongs; the class of pyridinyl-substituted 2-cyanonaphthalene compounds to which L-739,010 belongs; the class of 2-cyanoquinoline compounds to which L-746,530 belongs; the classes of indole and quinoline compounds to which MK-591, MK-886, and BAY x 1005 belong;
- (b)        Receptor antagonists for leukotrienes LTB<sub>4</sub>, LTC<sub>4</sub>, LTD<sub>4</sub>, and LTE<sub>4</sub> selected from the group consisting of the phenothiazin-3-one class of compounds to which L-651,392 belongs; the class of amidino compounds to which CGS-25019c belongs; the class of

benzoxalamines to which ontazolast belongs; the class of benzenecarboximidamides to which BIL 284/260 belongs; and the classes of compounds to which zafirlukast, ablukast, montelukast, pranlukast, verlukast (MK-679), RG-12525, Ro-245913, iralukast (CGP 45715A), and BAY x 7195 belong;

- 5 (c) PDE4 inhibitors including inhibitors of the isoform PDE4D;
- (d) 5-Lipoxygenase (5-LO) inhibitors; or 5-lipoxygenase activating protein (FLAP) antagonists;
- (e) Dual inhibitors of 5-lipoxygenase (5-LO) and antagonists of platelet activating factor (PAF);
- 10 (f) Leukotriene antagonists (LTRAs) including antagonists of LTB<sub>4</sub>, LTC<sub>4</sub>, LTD<sub>4</sub>, and LTE<sub>4</sub>;
- (g) Antihistaminic H<sub>1</sub> receptor antagonists including cetirizine, loratadine, desloratadine, fexofenadine, astemizole, azelastine, and chlorpheniramine;
- (h) Gastroprotective H<sub>2</sub> receptor antagonists;
- 15 (i)  $\alpha_1$ - and  $\alpha_2$ -adrenoceptor agonist vasoconstrictor sympathomimetic agents administered orally or topically for decongestant use, including propylhexedrine, phenylephrine, phenylpropanolamine, pseudoephedrine, naphazoline hydrochloride, oxymetazoline hydrochloride, tetrahydrozoline hydrochloride, xylometazoline hydrochloride, and ethylnorepinephrine hydrochloride;
- 20 (j)  $\alpha_1$ - and  $\alpha_2$ -adrenoceptor agonists in combination with inhibitors of 5-lipoxygenase (5-LO);
- (k) Anticholinergic agents including ipratropium bromide, tiotropium bromide, oxitropium bromide, perenzepine, and telenzepine;
- (l)  $\beta_1$ - to  $\beta_4$ -adrenoceptor agonists including metaproterenol, isoproterenol, 25 isoprenaline, albuterol, salbutamol, formoterol, salmeterol, terbutaline, orciprenaline, bitolterol mesylate, and pirbuterol;
- (m) Theophylline and aminophylline;
- (n) Sodium cromoglycate;
- (o) Muscarinic receptor (M1, M2, and M3) antagonists;
- 30 (p) COX-1 inhibitors (NSAIDs); COX-2 selective inhibitors including rofecoxib; and nitric oxide NSAIDs;
- (q) Insulin-like growth factor type I (IGF-1) mimetics;

- (r) Ciclesonide;
- (s) Inhaled glucocorticoids with reduced systemic side effects, including prednisone, prednisolone, flunisolide, triamcinolone acetonide, beclomethasone dipropionate, budesonide, fluticasone propionate, and mometasone furoate;
- 5 (t) Tryptase inhibitors;
- (u) Platelet activating factor (PAF) antagonists;
- (v) Monoclonal antibodies active against endogenous inflammatory entities;
- (w) IPL 576;
- (x) Anti-tumor necrosis factor (TNF $\alpha$ ) agents including Etanercept, Infliximab, and  
10 D2E7;
- (y) DMARDs including Leflunomide;
- (z) TCR peptides;
- (aa) Interleukin converting enzyme (ICE) inhibitors;
- (bb) IMPDH inhibitors;
- 15 (cc) Adhesion molecule inhibitors including VLA-4 antagonists;
- (dd) Cathepsins;
- (ee) MAP kinase inhibitors;
- (ff) Glucose-6 phosphate dehydrogenase inhibitors;
- (gg) Kinin-B<sub>1</sub> - and B<sub>2</sub>-receptor antagonists;
- 20 (hh) Gold in the form of an aurothio group together with various hydrophilic groups;
- (ii) Immunosuppressive agents, e.g., cyclosporine, azathioprine, and methotrexate;
- (jj) Anti-gout agents, e.g., colchicine;
- (kk) Xanthine oxidase inhibitors, e.g., allopurinol;
- (ll) Uricosuric agents, e.g., probenecid, sulfinpyrazone, and benzbromarone;
- 25 (mm) Antineoplastic agents, especially antimitotic drugs including the vinca alkaloids such as vinblastine and vincristine;
- (nn) Growth hormone secretagogues;
- (oo) Inhibitors of matrix metalloproteases (MMPs), i.e., the stromelysins, the collagenases, and the gelatinases, as well as aggrecanase; especially collagenase-1

(MMP-1), collagenase-2 (MMP-8), collagenase-3 (MMP-13), stromelysin-1 (MMP-3), stromelysin-2 (MMP-10), and stromelysin-3 (MMP-11);

- (pp) Transforming growth factor (TGF $\beta$ );
- (qq) Platelet-derived growth factor (PDGF);
- 5 (rr) Fibroblast growth factor, e.g., basic fibroblast growth factor (bFGF);
- (ss) Granulocyte macrophage colony stimulating factor (GM-CSF);
- (tt) Capsaicin cream;
- (uu) Tachykinin NK-1, NK-1/NK-2, NK-2, and NK-3 receptor antagonists, including NKP-608C, SB-233412 (talnetant), and D-4418;
- 10 (vv) Elastase inhibitors including UT-77, and ZD-0892; and
- (ww) Adenosine A2a receptor agonists.

## INTERNATIONAL SEARCH REPORT

International Application No

PCT/IB 01/00124

## A. CLASSIFICATION OF SUBJECT MATTER

IPC 7 C07D413/12 C07D417/12 A61K31/665 A61K31/67  
 //(C07D413/12,271:00,213:00),(C07D417/12,285:00,213:00)

According to International Patent Classification (IPC) or to both national classification and IPC

## B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

IPC 7 C07D A61K

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practical, search terms used)

EPO-Internal, BIOSIS, CHEM ABS Data

## C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category *	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
X	VINICK F J ET AL: "NICOTINAMIDE ETHERS: NOVEL INHIBITORS OF CALCIUM-INDEPENDENT PHOSPHODIESTERASE AND U3HROLIPRAM BINDING" JOURNAL OF MEDICINAL CHEMISTRY, US, AMERICAN CHEMICAL SOCIETY, WASHINGTON, vol. 34, no. 1, 1991, pages 86-89, XP002066969 ISSN: 0022-2623 page 87, right-hand column; table I	1,12
X	EP 0 773 024 A (PFIZER) 14 May 1997 (1997-05-14) the whole document	1,12
X	EP 0 357 316 A (PFIZER) 7 March 1990 (1990-03-07) page 3, line 21 -page 4, line 51; claims 1,7	1,12
-/-		

☒ Further documents are listed in the continuation of box C.

☒ Patent family members are listed in annex.

## \* Special categories of cited documents:

- \*A\* document defining the general state of the art which is not considered to be of particular relevance
- \*E\* earlier document but published on or after the international filing date
- \*L\* document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)
- \*O\* document referring to an oral disclosure, use, exhibition or other means
- \*P\* document published prior to the international filing date but later than the priority date claimed

\*T\* later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

- \*X\* document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone
- \*Y\* document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art.

\*G\* document member of the same patent family

Date of the actual completion of the international search

15 May 2001

Date of mailing of the international search report

05/06/2001

Name and mailing address of the ISA

European Patent Office, P.B. 5818 Patentlaan 2
